RE: 2530 Hamburg Turnpike, Lackawanna, NY (Brownfields Site C915191)
Site Closure Report – Supplemental Investigation/Interim Remedial Measure

Dear Ms. Ross:

On behalf of Mr. Frank Mathews, Jr., Iyer Environmental Group, PLLC (IEG) is pleased to submit for your review and approval the enclosed Site Closure Report for the above referenced site. The report text and data tables have been revised as per our discussions. Raw analytical data from the laboratory on Form 1s are bound together as a separate document (Compilation of Analytical Data). One set of copies of this Report will be placed in the public repository at the County Library in Lackawanna. A Fact Sheet, once approved by the NYSDEC, will also be mailed to the community contact list for this site.

I certify that the SI/IRM Work Plan was implemented and that all investigation and remedial activities were completed substantially in accordance with the Department approved Work Plan and were personally witnessed by me or an inspector under my direct supervision.

Please call me if you have any questions or need additional information.

Sincerely,

IYER ENVIRONMENTAL GROUP, PLLC

Dharmarajan R. Iyer, Ph.D., P.E., CES

SUPPLEMENTAL INVESTIGATION/INTERIM REMEDIAL MEASURE

2530 Hamburg Turnpike, Lackawanna, NY

EXECUTIVE SUMMARY

The 2530 Hamburg Turnpike LLC property is located on a major state route leading into downtown Buffalo (see Figure 1), adjacent to the Bethlehem Steel Plant. This 1.37-acre property is being redeveloped for commercial use as a gas station serving the Western New York community in an area designated as an Environmental Zone (both eligibility criteria A and B) by NYS ESD. Petroleum-related contamination on this property was attributed to a gas station operated during the 1950s. An expanded supplemental investigation program was implemented to include VOCs and other contaminants from industrial activities in the area. The Supplemental Investigation (SI) and Interim Remedial Measure (IRM) were detailed in a Work Plan dated April 2005 (Reference 1), and amended in July 2005 (Reference 2).

Supplemental Investigation: The supplemental investigation was conducted over two rounds. The first round included surficial and subsurface soil sampling (to bedrock) at 16 locations, and the installation and sampling of 4 groundwater monitoring wells. The first round samples were analyzed for VOCs, SVOCs, pesticides, PCBs, metals and cyanide. The second round was expanded (based on the first round results) to include 18 additional soil boring locations (up to 6' depth) on the property, and 5 background soil samples from the residential neighborhood for SVOCs and metals.

The site soil includes, from the top, asphalt or a thin layer of topsoil, slag fill from the area's iron and steel making operations, clayey silt and silty clay. Bedrock occurs at a depth of 13 feet on the east to 19 feet on the west. Soil VOC contamination was limited to the southwestern section designated for removal action based on previous investigations. Outside of this area, total VOCs was in the range of non-detect to 0.034 ppm. SVOC hot-spots were found along the northern property boundary with up to 23.1 ppm within the property, and 1,276 ppm just north of the boundary. Another SVOC hot-spot existed by the southeast property corner. Cyanide was not detected in any sample, and pesticides and PCBs were detected at trace levels. Groundwater was contaminated in the old gas station area with sub-ppm levels of VOCs.

Qualitative Risk Assessment: Pathways for contaminant migration from the site include air (fugitive dust) and groundwater (rainwater infiltration). Volatile organics, semivolatile organics and heavy metals are the primary contaminants of concern as they were present in the soil at elevated levels, and in the groundwater at low levels. The two routes had to be mitigated to eliminate risks to human health when the site is put to commercial use. The removal of surficial and subsurface soils from areas of VOC contamination and SVOC hot-spots, and the scraping of surficial soils from the rest of the site will mitigate human and environmental impact to a great extent. Any contact with residual soil contamination will be prevented with construction of a building and paving of most of the remaining area on the property for the gas station.

Interim Remedial Measure: The interim remedial action consisted of the excavation and off-site disposal of contaminated soils from four distinct areas (see Drawing 4): Area A with VOC contamination, Area B with both VOCs and SVOCs, and Areas D and E with SVOC hot-spots. A total of 5,908 tons of contaminated soil was excavated from the four areas: 4,489 tons from Area A, 190 tons from Area B, and 1,229 from Areas D and E. Excavation water was pumped to two 20,000-gallon Baker tanks prior to treatment with two bag filters and two activated carbon drums in series, and subsequently discharged into the sanitary sewer. The excavated areas were backfilled with clean bank-run gravel from Mathias, NY and clay from the Buffalo Stone quarry in Clarence, NY. Analytical results confirmed that off-site fill was suitable for site use.

The wall samples from Areas A and B were free of petroleum compounds except for a small section along the western boundary where further excavation was not possible due to the proximity of the highway and possible safety concerns. Total SVOCs in the confirmatory soils ranged from 0.022 to 9.45 ppm. Residual contamination in the confirmatory soil samples was slightly above the TAGM-4046 SCOs. [Note: The residual SVOCs slightly exceed the proposed SCOs for draft Track 1, unrestricted use, in the Draft revised regulations in 6 NYCRR 375, but are well below the proposed SCOs for draft Track 2, restricted commercial use. However, these regulations are still under review/comment and will not be effective until later in the year]

The results of confirmatory soil sampling show that the remediation goals have been met for the site. Due to the presence of area wide residual contamination associated with past industrial practices in the area and the proximity of the property to a major traffic route, the site cannot be designated for unrestricted use (Track 1). The asphalt paving across the property will prevent human contact with the subsurface soils. In addition, with the drainage swales, runoff will be diverted without coming in contact with the residual contamination. The site will thus be suitable for restricted commercial use.

1.0 INTRODUCTION AND PURPOSE

The 2530 Hamburg Turnpike LLC property is on a major state route leading into downtown Buffalo (see site location map on Figure 1). It is in the vicinity of the Bethlehem Steel facility, and is bordered to the west, east and south by Route 5 (Hamburg Turnpike), Albright Court and Dona Street, respectively. A vacant property lies to the immediate north of this property. This 1.37-acre property was purchased by Mr. Frank Mathews with the purpose of redeveloping it into a commercial gas station to serve the Western New York community, thereby endeavoring to revitalize an area designated as an Environmental Zone (both eligibility criteria A and B) by NYS ESD. 2530 Hamburg Turnpike LLC is thus a volunteer applicant taking the initiative to clean up this property under the Brownfields Cleanup Program before developing it for commercial use. The layout of the proposed new gas station with a food mart is shown on Drawing 1.

Petroleum-related contamination found during previous investigations on this property was attributed to a gas station that operated well before the current ownership. Due to the likely presence of other contaminants as a result of this property's location in an industrial area, an expanded supplemental investigation was proposed to address areas of the property not targeted in previous investigations and to assess the presence of any contamination related to past practices in the area. The Work Plan dated April 2005 (Reference 1) detailed the Supplemental Investigation (SI) and an Interim Remedial Measure (IRM). The proposed remedy included the removal of contaminated soil and groundwater associated with past use of the property as a gas station, and any other areas identified by the supplemental investigation.

In April 2005, 2530 Hamburg Turnpike LLC entered into an agreement with the NYSDEC to remediate the site under the State Brownfields Cleanup Program. The approved SI/IRM Work Plan was made part of this agreement. The supplemental investigation was performed in May-June 2005 in two rounds. The results of the supplemental investigation became the basis for expanding the remedial action from areas of petroleum contamination to include metals and semivolatile organics contamination. In July 2005, an Amendment (Reference 2) to the April 2005 SI/IRM Work Plan was submitted to the NYSDEC. The revised interim remedial measure was implemented in July 2005 and all site work was completed in September 2005.

This Report presents in detail the work performed during the supplemental investigation and the interim remedial measure. Raw analytical data on laboratory Form 1s are provided as a separate document with summary tables (Compilation of Analytical Data).

2.0 SITE DESCRIPTION AND HISTORY

A Transaction Screen Environmental Site Assessment (TSA, Reference 3) in February 2004 cited historical records indicating the use of the property as a gas station in the 1950s. The TSA also found a 1990 Phase I Report for the adjacent Bethlehem Steel facility that indicated another gas station at the northern edge of the property apparently owned by Atlantic Richfield.

A one story office building with a basement was constructed on the lot and used until early 2005 by a credit union. This 1,900-sf building was donated by Mr. Mathews to the

church on Dona Street and was moved by him next to the church in November 2004. The basement was backfilled with clean fill and graded. At the beginning of the supplemental investigation, the entire lot was vacant with no structures of any kind.

Following the February 2004 Transaction Screen Assessment, a limited and focused subsurface soil investigation was funded in April 2004 (Reference 4) by Mr. Mathews to better assess the likelihood of petroleum related contamination around the former gas station location. After this investigation revealed volatile (VOC) and semivolatile (SVOC) organic contamination in the subsurface soils, Mr. Mathews authorized a supplemental subsurface soil and groundwater investigation at the site. This work was completed in July 2004 (Reference 5). The results of these investigations were used to develop a remediation plan to alleviate the petroleum related contamination.

The adjacent properties, including the Bethlehem Steel site, have been the subject of various investigations in the past several years, and various types of contamination have been found in soils and groundwater. Given the long history of industrial and commercial use of properties in the area, there were concerns about the possible presence of other types of contaminants besides petroleum. The supplemental investigation program was therefore added herein to investigate the possible presence of contamination in soil and groundwater from historical practices in the area, including volatile and semivolatile organics, pesticides, PCBs and heavy metals.

3.0 SUMMARY OF ENVIRONMENTAL CONDITIONS

The property is relatively flat at an elevation of around 578' amsl. As part of the Phase II site assessment in April and July 2004 (see References 4 and 5), a total of 22 soil boring locations (see locations and analytical results on Drawing 2) were completed within the southwest part of the property, around the area of the former gas station. Based on the results of the initial soils analysis and field screening, 11 of the borings were converted to temporary groundwater wells (piezometers) set to 15 ft. depths.

The subsurface is characterized by asphalt (on part of the property as shown on Drawing 2), fill (up to 2 feet), sandy gravel (from 2 to 4.5 feet), silty clay/clayey silt (from 4.5 to 16 feet). Groundwater was encountered at a depth of 8 to 9 ft. Vegetation on this property is typical of areas with a very small layer of topsoil and inert fill material, which consists primarily of slag from iron and steel production from the adjacent plant.

Soil and groundwater samples from these locations were analyzed for volatile and semivolatile organics. Soil samples from 6 of the 22 locations had VOC and/or SVOC compounds exceeding the NYSDEC's TAGM-4046 values, while 5 of the 11 groundwater samples had VOCs exceeding the NYSDEC Class GA groundwater standards. A plume of contamination was mapped out as a result of the July investigation as shown on Drawing 2.

4.0 REGULATORY CRITERIA

The NYSDEC has established goals for acceptable contamination levels in soils based on a combination of human health risk factors and potential groundwater impacts. These goals are applicable when considering the need for a remedial measure at contaminated sites.

NYSDEC's Technical and Administrative Guidance Memorandum for the determination of soil cleanup objectives (SCOs) and cleanup levels (TAGM-46, Reference 6) currently dictate the course of remedial action at contaminated sites in New York State. The recommended SCOs in TAGM-4046 for individual compounds are listed in the analytical data tables for site soil samples. Under the TAGM-4046 guidelines, a remediated site will qualify for unrestricted use if the residual contaminants are all below the corresponding SCOs. Otherwise, suitable deed restrictions and easements will have to be in place for site closure and its future use.

Although not applicable at this time, a new set of SCOs for site remediation should be in effect within the next year. These SCOs have been proposed in the draft revised regulations (6 NYCRR Part 375.3, Reference 7) for the Brownfield Cleanup Program using a four-track approach to the remediation of soil contamination: Track 1, unrestricted use; Track 2, commercial and industrial use with groundwater engineering and institutional controls; Track 3, unrestricted, commercial and industrial use applying the formula used to develop tracks but applying site-specific data, and Track 4, site-specific soil cleanup objectives with engineering controls. For information, the proposed new SCOs under the draft Tracks 1 and 2 are also listed with the TAGM-4046 values in the analytical data tables.

Standards for groundwater quality as provided in 6 NYCRR Part 703 (Reference 8) are included in tables with the groundwater monitoring data.

Excavation and off-site disposal of the contaminated soils were compliant with State and Federal solid waste disposal requirements, the Resource Conservation and Recovery Act (RCRA) and the Toxic Substances Control Act (TSCA).

5.0 SUPPLEMENTAL INVESTIGATION

5.1 Objectives

Previous investigations were limited to the southwest part of the property, and a significant portion of this area was already designated for the interim remedial measure consisting of removal and off-site disposal of contaminated soils. The remainder of the property needed to be further assessed with respect to possible environmental contamination resulting from other operations in and around the property. Additional data was also needed to complete the assessment, remediation and closure of this property under the Brownfields Cleanup Program. The objectives of this supplemental investigation were therefore as follows:

- Determine the extent of on site contamination beyond the limits of previous investigations,

- Establish the groundwater table and obtain other hydrogeological data such as groundwater flow,
- Qualitatively assess exposure pathways and potential risks to human health and the environment, and
- Re-evaluate the proposed remedy for the petroleum contamination, and expand it as necessary to include any other areas of contamination.

5.2 Sampling Program

The supplemental investigation was conducted over two rounds. The first round included surface and subsurface soil sampling, and the installation and sampling of groundwater monitoring wells. The second round of soil sampling was conducted to further assess the extent of SVOC and heavy metal contamination across the site. Prior to the intrusive field work, public underground utilities were cleared in the sampling area through the Dig Safely New York program. Photos taken during the site investigation are included in Appendix A.

5.3 First Round Investigation

5.3.1 Soil Sampling and Analysis

SAMPLING: Field work for the supplemental investigation was performed in May 2005 in accordance with the approved SI/IRM Work Plan. Soil samples were collected from twelve boring and four monitoring well locations, and were analyzed for VOCs, SVOCs, pesticides, PCBs, metals and cyanide. The soil borings (SB-1 through SB-12, and MW-1 through MW-4) were located (see Drawing 3) across the site focusing on areas not previously investigated, including a couple at the southwest corner of the property. Most of the sample locations were therefore outside of the area designated for removal action.

Using a drill rig, soil borings were completed at sixteen locations from ground surface to 20 feet (or refusal, whichever came first) during the first round, four of which were completed into monitoring wells. A 4-foot long, 2-inch diameter stainless steel split-spoon with a plastic sleeve was used for soil sampling. After the split spoon was extracted from the ground, the spoon was split open, and the sleeve was cut to expose the sample. The soil core was screened in the field with a photoionization detector (PID) that analyzes volatile organics in the air space around the soil samples. Selected soil borings representing the extent of the property were visually inspected by a geologist and transcribed into boring logs (included as Appendix B).

Soil samples were sent from each boring location for laboratory analysis (see Table 1). At each location, the top two to four feet of soil was sent for metals analysis. The top four feet was composited (after sampling for metals) for SVOCs and pesticide/PCBs. Deeper intervals (anywhere from 8 to 20 feet) were sampled for VOC analysis based on field PID readings. All samples were delivered on the same day to an ELAP-certified analytical laboratory (Severn Trent Laboratories, Buffalo, NY). Analytical methods and QA/QC, including matrix duplicates and spikes, and field blanks and duplicates were in accordance with NYSDEC's ASP protocols and USEPA methods, as applicable.

PHYSICAL CHARACTERISTICS: The nature of the soil at the site is described by location and sampling interval in Table 2. Additional characterization is provided with the

boring logs (appendix B) at selected soil boring locations. The southern portion of the property (approximately 20%) is paved with asphalt. The remaining area has sparse vegetation with a very thin layer of top soil.

Beneath the topsoil or asphalt is brown-black slag mostly ranging in thickness from 1 to 2 feet. The slag fill is associated with historical iron and steel making operations at the Bethlehem Steel plant site across the street. Over the years, slag generated at the steel plant was used to convert the lake's shore line into useable land.

Below the slag is a layer of fine grey-brown sand mixed with some silt and ranging in thickness from 1 to 2 feet. The rest of the soil column is silty clay (grey, olive or black) down to a depth of 13 to 19 feet at which point black shale rock was encountered. The depth to bedrock increases from east to west, as the bedrock slopes towards the lake. Based on field observations of the soil column in the split spoons, groundwater seems to appear at a depth of 10 to 12 feet.

CHEMICAL CHARACTERISTICS: Field PID readings of the soil borings are included in Table 2 along with visual observations. PID readings were less than 0.5 ppm for all the soil borings except for SB-12 which was slightly higher (2.8 ppm). The soils at the monitoring well locations also had low PID readings (less than 0.8 ppm) except for MW-3 which was at 7.3 ppm.

Analytical data for the soil boring samples from the first round of sampling are tabulated by analytical parameters in Table 3. For comparison, Table 3 includes the values for the soil cleanup objectives (SCOs) in TAGM-4046 which are currently applicable. For information, proposed SCOs for draft Track 1 (unrestricted use) and draft Track 2 (restricted residential or commercial use) under the draft revised 6 NYCRR Part 375 regulations are also included in the table. Concentrations exceeding the TAGM-4046 SCOs are shown in bold font. Total VOC and SVOC concentrations are shown on Figures 2 and 3 respectively, and also listed on Drawing 3.

The site has VOC contamination in areas associated with the former gas station operation, and SVOC and heavy metal contamination associated with the iron and steel making operations of the adjacent plant. Cyanide was not detected in any of the samples. Pesticides and PCBs were not detected in over half the samples, and the remaining samples had only trace levels (less than 0.016 ppm of any individual compound), orders of magnitude below the corresponding SCOs.

Total volatile organics ranged from non-detect to a maximum of 12.3 ppm in soil samples from locations outside of the areas (Areas A and B on Figure 2) already targeted for removal action. Acetone, methylene chloride and carbon disulfide were at trace levels (less than 32 ppb) typical of possible laboratory contamination. The remaining VOC compounds detected at the site were benzene and its derivatives associated with petroleum. Only one sample (MW-3 in the southwest corner) had elevated concentrations (up to 8.9 ppm) while three others had trace levels (less than 0.006 ppm) of the petroleum-based compounds.

Total semivolatile organics ranged from 23.1 to 1,276 ppm along the northern property boundary, and from 0 to 46 ppm across the remainder of the property. Most of the SVOC compounds found at the site, including the carcinogenic polynuclear aromatic hydrocarbons (PAHs), are also found in coal combustion products and slag. Individual

compounds were in the range of 0.2 to 260 ppm. Benzo(a)anthracene, benzo(b)fluoranthene, fluoranthene, phenanthrene and pyrene were found in excess of 100 ppm at one location (SB-2) just north of the property boundary.

A few heavy metals (mercury, chromium, iron, manganese, nickel and zinc) exceeded the numeric values in TAGM-4046. [Note that all the metals with the exception of manganese were below the proposed SCOs for draft Track 2 (residential or commercial) in the draft revised 6 NYCRR Part 375.3.]

SUMMARY: The results of the first round sampling confirmed that the VOC contamination was limited to the southwest section (Areas A and B) of the property. SVOC contamination was found to be relatively high along the northern property boundary and in one spot by the southeast corner. Based on a review of the first round analytical results, additional sampling was deemed necessary to further define the extent and depth profile of SVOC contamination, particularly carcinogenic PAHs, and heavy metals across the property. Background soil sampling was also included in the second round for comparison with site soils.

5.3.2 Monitoring Well Installation and Development

At least three groundwater monitoring wells are needed to establish the groundwater table and flow gradient. Given the plume of known petroleum contamination, and potential migration of contaminants, four permanent monitoring wells were installed at the locations shown on Drawing 3. Two wells were located along the western property boundary, one on the southern boundary, and one in the northeast corner of the property. In addition, a pumping well (PW-1) was also installed within the zone of petroleum contamination (see Drawing 3) after over a foot of floating petroleum product was observed in piezometer TPMW-10.

The monitoring wells were installed to bedrock at depths ranging from 11.5' (MW-2 at the southeast corner) to 16.5' (MW-4 on the western boundary slightly north of the bus station) as shown on Figure 5. Each monitoring well has a 2" diameter PVC screen straddling the water table from the bottom up, and a PVC riser. The wells are packed with sand at the bottom, bentonite above it, and bentonite cement further up at depth intervals shown on Figure 5. Each well has a stick-up casing with a lockable cap.

The pumping well was installed with an 8" diameter stainless steel screen (PVC screen was not available with the driller at the time) to a depth of 15 feet, and a PVC riser sticking up 3' above ground. This well did not yield any floating product during development and was eventually abandoned during site remediation.

The new wells were developed by purging with a battery powered whaler pump as per NYSDEC guidelines for monitoring well development. During well development, field measurements (depth, purged volume, pH, specific conductivity, temperature and turbidity) were measured and recorded onto field forms (see Table 4).

Wells MW-1 and MW-2 had very slow recharge rates, MW-3 was moderate, and MW-4 recharged very rapidly. Purging at MW-1 and MW-2 was stopped when the turbidity went well below 50 NTU with over five well volumes pumped. The purged groundwater at Wells MW- 3 and MW-4 did not become clear even after pumping several gallons (14 well volumes for MW-3 and 73 well volumes for MW-4) the first time, and were

redeveloped after a few days. MW-3 was still turbid the second time even after pumping an additional 71 well volumes, and MW-4 became clear after purging an additional 105 well volumes. The high purge volumes were possible with MW-4 because of its relatively high recharge rate.

5.3.3 Survey

The first round soil borings and monitoring wells were surveyed along with the piezometers from the Phase II site assessment, and the site plan was updated to include the sampling points. Raw survey data from Robert Baird, LS is included in Appendix C, and the soil boring coordinates and well details derived from the survey are tabulated in Table 5.

5.3.4 Groundwater Level Measurements

Groundwater levels were measured in all the wells and piezometers during well development to establish a baseline ground water table elevation and groundwater flow gradient. The groundwater levels were measured two more times during the first round investigation.

Table 6 shows the groundwater elevations while the groundwater contours are plotted using the SURFER software. While the regional groundwater flow may be expected to be towards Lake Erie to the west, the localized groundwater flow pattern appears to be in the southeast direction. This could also be an artifact of subsurface conditions at the site as affected by past activities. The groundwater appears to have changed following site remediation as observed during a subsequent water level measurement (9/14/05).

5.3.5 Groundwater Sampling and Analysis

SAMPLING: The four monitoring wells were sampled for the same parameters as the soil samples in the first round (i.e., VOCs, SVOCs, PCBs, pesticides, metals and cyanide) as listed in Table 1. Disposable bailers were used for sample collection. The samples were delivered to the analytical laboratory on the day sampled.

CHEMICAL CHARACTERISTICS: Analytical data for the groundwater samples are presented in Table 7. No VOCs were detected in wells MW-1 and MW-2 which are outside the plume of previously identified petroleum contamination. MW-3 and MW-4, which are along the southwest border in the old gas station area, had five VOCs ranging from 0.002 to 0.13 ppm. Even though the subsurface soil at MW-3 had VOCs significantly higher than all the other soil samples (see Table 3), the groundwater at this well did not show correspondingly higher VOC levels (see Table 7). Groundwater standards were slightly exceeded in MW-3 for xylene at 0.02 ppm and in MW-4 for benzene at 0.002 ppm.

Only iron, manganese, selenium and sodium exceeded the State groundwater standards. Cyanide was not detected in any of the groundwater samples.

5.4 Second Round Investigation

The first round investigation revealed the presence of elevated levels of SVOCs and metal in areas outside the plume of petroleum contamination identified in previous

investigations. Consequently, a second round investigation was performed in June 2005 and consisted of surficial and subsurface soil sampling on the property, and background soil sampling in the residential neighborhood near the site. All samples were analyzed for SVOCs and metals.

5.4.1 Soil Sampling and Analysis

SAMPLING: A total of 18 soil boring locations as shown on Drawing 3 were sampled with a drill rig and split spoons at 2 feet intervals to a maximum depth of 6 feet. Several locations were chosen along the northern property and other areas outside the plume of petroleum contamination to identify SVOC hot spots, and to assess the distribution of the contaminants.

All samples for SVOC and metals analysis were collected from the top four to six feet below ground level, which includes up to two feet of slag from the local industry. Two samples were collected from each location. The top layer of slag plus 6" of native material below it was composited and sampled for metals analysis. Then 2 feet of native material below the first sample were sampled and analyzed for SVOCs. An additional two feet of soil was sampled in areas where the recovery from the upper depths was poor. The deeper samples from select locations were analyzed for metals.

PHYSICAL CHARACTERISTICS: The physical description of the soil samples from the second round is included in Table 2. The soil characteristics are as described in Section 5.3.1 above.

CHEMICAL CHARACTERISTICS: No VOCs were detected using the PID in split spoon soil samples from the second round or were below background.

Analytical data for the soil boring samples from the second round of sampling are presented in Table 8. For comparison, Table 8 lists SCOs from TAGM-4046 that is currently applicable for site remediation. Concentrations exceeding the TAGM-4046 SCOs are shown in bold font. Total SVOC concentrations are included on Figure 3 and on Drawing 3 along with the results from the first round sampling. For information, the proposed SCOs for draft Track 1 (unrestricted use) and draft Track 2 (restricted residential or commercial use) in the draft revised 6 NYCRR Part 375 are also shown.

For the soil samples from the second round, total semivolatile organics ranged from 0.09 to 114 ppm in samples that contained semivolatile compounds. Between the two rounds of sampling, the highest concentration of total SVOC occurred at SB-24 (in Area E on Figure 3) which is an order of magnitude less than the 1,276 ppm total SVOC found at SB-2 just across the northern property boundary. The maximum concentrations of individual compounds ranged from 0.018 ppm (diethyl phthalate) to 29 ppm (benzoic acid). The maximum concentrations for seven semivolatile compounds exceeded TAGM-4046 SCOs.

Ten of the twenty metals exceeded the numeric values in TAGM 4046. [Note: All the metals were below the proposed SCOs for draft Track 2, restricted commercial use, while only two metals (chromium and manganese) exceed the SCOs for draft Track 1, unrestricted use.]

5.4.2 Background Soil Sampling and Analysis

Background soil samples were collected at the five locations shown on Figure 5 from residential areas (see Figure 4) in the neighborhood for comparison and establishment of site specific cleanup levels, if necessary. The analytical results are tabulated in Table 9. Total SVOCs ranged from 13.6 ppm to 43.2 ppm, with five SVOCs exceeding the TAGM-4046 SCO values. Eight metals exceeded the corresponding SCOs in TAGM-4046. [Note: Four SVOCs exceeded the proposed SCOs for draft Track 2, restricted residential use.]

The range of contaminant concentrations and their averages in the site soil and background soil samples are compared in Table 10. The SVOCs are significantly higher on site in comparison to the residential background, while the metals are within the same order of magnitude.

5.4.3 Survey

The property was resurveyed to locate the second round soil borings on the site map. The raw survey data in Appendix C includes the updated survey information from the second round.

5.5 Magnetometer Survey

The southwest property encompassing the previously identified plume of petroleum contamination was surveyed with a metal detector (Schonstedt model MAC-51Bx receiver/transmitter) to locate anomalies that could be underground tanks or piping. Due to interference from the presence of slag at the ground surface from iron and steel making operations, no distinct underground features, if any, could be delineated.

5.6 Summary of Supplemental Investigation

The Supplemental Investigation included two rounds, the first round consisting of soil and groundwater sampling and analysis, and the second round expanded the sampling program for additional site soils and background soils. In the first round, soil and groundwater were analyzed for VOCs, SVOCs, pesticides, PCBs, metals and cyanide.

VOC contamination was limited to the southwest section of the property in the area previously identified for removal action. SVOCs were found across the site, with the highest levels along the northern property boundary and in a small area by the southeast corner. Heavy metals were present primarily in slag fill in surficial soils.

6.0 QUALITATIVE RISK ASSESSMENT

A qualitative risk assessment was performed to assess potential human health and environmental risks associated with the site. This assessment is based on the results of site investigations and the intended future commercial use of the property. The owner is in the process of building a gas station on the property.

6.1 Data Collection and Evaluation

Site investigations on the property began with a Phase II environmental assessment in July 2004, and the supplemental site investigations completed in July 2005 as part of the SI/IRM. The site is characterized by soil contamination with elevated levels of volatile organics, semi-volatile organics (particularly PAHs) and metals, and groundwater contamination with trace VOCs. The soil matrix is of primary concern, and addressing this concern should alleviate the low level groundwater contamination.

The soil data tables (Tables 3 and 8) include SCOs for the parameters of concern from the NYSDEC's guidance values in TAGM-4046, and, for information, the proposed SCOs in the draft revised 6 NYCRR Part 375.3 regulations for the Brownfields Cleanup Program. Five background samples were collected from the residential neighborhood (see Table 9). The semivolatile organics and metals present in the background soils appear to be typical of the location that has historically had an iron and steel making plant for several decades. There are no surface water receptors in the immediate vicinity of the property.

Groundwater contamination is found only in the old gas station area designated for soil removal action, and is primarily due to non-chlorinated hydrocarbons that only slightly exceed guidance values. The potential for the migration of the site contaminants to the groundwater is limited by the tight clays straddling the water table.

6.2 Exposure Assessment

The property is located in a zoned industrial area of the city. A gas station operated on the southwest corner of the property in the 1950s. Another gas station existed by the northwestern edge around the same period.

Pathways that currently exist for contaminants to migrate from the site include:

Air:	Fugitive dust from erosion of contaminated surface soils or construction activities at the site
Groundwater:	Rainwater infiltration and leaching of contaminants

Given the nature and extent of contamination and the land use scenarios, populations in the vicinity of the site are affected by the following exposure routes of site contaminants under current conditions:

- Inhalation of particulates containing airborne contaminants
- Ingestion of contaminated soil or groundwater
- Dermal contact with contaminated soil or groundwater

Volatile organics, semivolatile organics and heavy metals are the primary contaminants of concern as they were present in the soil at elevated levels, and in the groundwater at low levels. Volatilization of contaminants does not appear to be of concern under existing conditions since VOC contamination is limited to the subsurface soils and groundwater. The soil in the area of petroleum contamination was targeted for excavation and off-site disposal to eliminate the source of groundwater contamination. VOCs were of concern during remediation and were monitored when VOC contaminated soil and groundwater were exposed.

Human exposure to contaminants at the site could have occurred under conditions existing prior to remediation, during remediation, and during the intended future use of the site for commercial purposes. Populations potentially exposed are those that come in contact with the above two modes of contaminant migration. These two routes had to be mitigated to eliminate risks to human health when the site is put to industrial or commercial use.

The removal of surficial and subsurface soils from areas of VOC-contamination and SVOC hot-spots, and the scraping of surficial soils from the rest of the site will mitigate human and environmental impact to a great extent. The site is being redeveloped as a commercial establishment with a gas station. It is located on a major state route leading into the City of Buffalo. A new building will be completed with automobile related supplies and food service, and gas dispensing islands will be installed. Most of the area outside the building will be paved with asphalt for automobile access. Under this use scenario, the contaminant migration and exposure pathways will be further mitigated.

7.0 INTERIM REMEDIAL MEASURE

7.1 Extent of Contamination

Four distinct areas with elevated contaminant levels were identified based on the results of the supplemental investigation. The area shaded as (A) on Drawing 4 constituted the bulk of the excavation due to VOC contamination, while Area B had both VOC and SVOC contamination. Areas D and E had SVOC hot-spots exceeding soil cleanup guidance values by significant levels. The remainder of the property (Area C) is free of petroleum contamination but appears to have low level SVOCs that slightly exceed TAGM-4046 SCOs.

7.2 Description of Remedy

The interim remedial measure was initially developed (see April 2005 Work Plan) based on the results of the soil and groundwater investigations completed by the owner in April and July, 2004. This remedy was expanded (see July 2005 Amendment to Work Plan) following the supplemental investigation to include additional areas of contamination primarily attributed to SVOCs.

The remedial measure included the excavation of contaminated soils exceeding the recommended TAGM-4046 soil cleanup objectives for petroleum compounds, and SVOCs hot spots from the four areas delineated on Drawing 4. Two 20,000 gallon Baker tanks, two bag filters and four 55-gallon activated carbon drums were provided to store and treat excavation water prior to discharge into the sewer. Arrangements were made with the Tonawanda Solid Waste Landfill for the disposal of excavated soils from the site. The sequence of work was as follows:

- a. Area D – Excavate to depth of 4'; dispose soil off-site
- b. Area E - Excavate to depth of 4'; dispose soil offsite
- c. Confirmatory sampling in Areas D and E
- d. Area A – Excavate to bedrock; dispose off-site

- e. Set up Baker tanks, filters and carbon drums for water treatment; pump and treat as necessary, and discharge to sanitary sewer
- f. Area B – Excavate in 2' steps to access Area A; dispose soil off-site
- g. Area D – Excavate additional soil based on confirmatory soil analysis
- h. Backfill Area D and E
- i. Remove old USTs found in Area A/B
- j. Complete Excavation in Areas A and B
- k. Backfill Area A with clayey fill from off-site and from Area D (to be excavated for new petroleum USTs)
- l. Excavate top 8" – 12" from remaining areas (C) on property and mix with crushed creek gravel for use as backfill in Area A.
- m. Top off Areas A and B with crushed creek gravel
- n. Grade all areas in preparation for pavement, building, etc.

Site work for the Interim Remedial Measure began with equipment mobilization on July 29, 2005 and all work was completed on September 21, 2005. Site photos taken during the remedial work are included in Appendix D. Appendix E contains the Daily Field Reports while the Weekly Summary Reports are in Appendix F. Field forms used to record air quality during the soil excavation and soil loads leaving the site are included in Appendix G.

7.3 Mobilization and Staging

Mobilization began with the delivery of excavation equipment to the site. Perimeter fencing was installed around the site to restrict site access to remedial personnel, and the boundaries of the excavation areas were marked. Given the magnitude of the site work and personnel on site, an office trailer was not deemed necessary. A temporary stockpile area with a plastic liner was established next to Area D to enable the contractor to begin excavation.

For landfill approval, samples were analyzed for disposal parameters to confirm that the soil was non-hazardous (data is included in the separate document entitled Compilation of Analytical Data for this SI/IRM). For the VOC only contamination area, 5 samples were analyzed for the disposal parameters which included pH, flashpoint, TPH, TCLP benzene and total lead. For the other areas, 3 samples were analyzed for pH, TPH, and for TCLP VOCs, SVOCs, pesticides and metals. Based on the analytical results, the contaminated soil from this site was accepted for disposal by the Tonawanda Landfill (Tonawanda, NY), a permitted solid waste landfill.

7.4 Soil Excavation and Off-Site Disposal

Excavation was carried out with a backhoe large enough to reach a depth of up to 16 feet. The walls of the excavation were adequately sloped or stepped to prevent cave-ins and washouts, and to allow access for excavators into the excavation. After the first few days, contaminated soils were excavated and directly loaded on to dump trucks for off-site disposal. The dump trucks were covered during transport to the disposal facility.

After excavation to the designated limits in each area, the excavation walls and bottom were sampled for volatile organics (Areas A, B and E) and SVOCs (Areas B, D and E) to confirm that the remedial objectives had been met. Confirmatory soil samples were

collected in accordance with NYSDEC requirements for spacing and delivered on the day of sample collection to the analytical laboratory.

Confirmatory soil sample locations are shown on Drawing 4 along with the limits of excavation, and are reproduced on Drawing 5 with all samples from the site investigations. Analytical results for the confirmatory samples are presented in Table 11, and total VOCs and SVOCs are shown with the sample locations on Figures 8 and 9 respectively.

A complete listing of soil loads and associated quantities is provided in Appendix H. Soil removal quantities for the four excavation areas are as follows:

AREA	TRUCK LOADS	DISPOSAL QUANTITY	TYPE OF CONTAMINATION
Areas A and B	185	4,489.68 tons	petroleum
Area B	8	189.60 tons	Petroleum and semivolatile
Areas D and E	62	1,228.92 tons	semivolatile
TOTAL	255	5,908.20 tons	

AREAS A and B: While both Areas A and B required excavation due to petroleum related contamination, Area B also showed SVOC contamination, particularly in the western portion. A total of 185 truck loads of petroleum contaminated soil were excavated from these two areas, and an additional 8 truck loads of SVOC contaminated soil was excavated from Area B.

Area A was excavated to bedrock, for a total depth of 12 to 15 feet. The initial plan was to excavate Area B to a depth of 4 feet. However, seeps in the northwest corner of Area A and B with petroleum contamination required further excavation. Two underground storage tanks were also unearthed (locations shown on Drawing 1) during soil excavation. A 3,000 gallon gasoline UST containing approximately 2,800 gallons of water/product mixture was found in Area A along the eastern boundary, and a 500 gallon waste oil UST, filled with water and some product/water mixture, was found in the eastern section of Area B. The areas around the USTs were excavated until PID readings were low. The two USTs were emptied of their contents for off-site disposal, cleaned on-site and then taken to a metal recycling facility.

Confirmatory wall samples were collected from 9 locations in Area A for VOC analysis. A total of 11 samples (6 wall and 5 bottom locations) were collected from Area B. All samples from Areas A and B were analyzed for VOCs. Soil samples from the western portion of Area B were also analyzed for SVOCs.

Seven wall samples from Area A had total VOCs ranging from 0.006 to 0.046 ppm (mostly acetone and methylene chloride, both common laboratory contaminants). The remaining two wall samples (AW-3 and AW-4 located within a few feet from the bus

stand on Route 5) had 19.8 and 60.1 ppm total VOCs respectively. Further excavation was not possible in this location due to the possibility of side wall collapse and possible resulting damage to the bus stop and the utility poles next to it. Wall and bottom samples from Area B had total VOCs (mostly methylene chloride) ranging from 0.006 to 0.049 ppm, and total SVOCs ranging from non-detect to 6.9 ppm.

AREA D: Area D was found during the site investigation to be contaminated with elevated levels of semivolatile organics (SVOCs), primarily polynuclear aromatic hydrocarbons (PAHs). This area was excavated first as per the proposed plan in the Amended IRM Work Plan (Reference 2). After the excavation of 38 loads, confirmatory soil samples were collected from 14 locations (10 wall and 4 bottom samples) and were analyzed for SVOCs.

Two samples had total SVOCs in the hot spot range (bottom sample DB-1 at 35 ppm and wall sample DW-5 at 20 ppm), and the remaining samples ranged from non-detect to 9.5 ppm (see Table 2). While the samples exceeded the SCO for individual carcinogenic PAHs in TAGM-4046, total SVOC concentrations were less than a tenth of the TAGM-4046 value of 500 ppm. DB-1 is an excavation bottom sample and this area is designated for treatment tanks for water from the car wash. The excavation was therefore extended by another 2.5 feet here, for a total of 6.5 feet below ground surface. DW-5 is a wall sample in the northwest corner, and the excavation at this location was extended further north by approximately 15 feet. An additional 7 truck loads were excavated from these two locations. Confirmatory samples were then collected; bottom sample DB-1B showed no SVOCs while wall sample DW-5B had 3.9 ppm total SVOC.

AREA E: This area was excavated because of SVOC contamination. 20 truckloads of contaminated soil were initially removed from this area. During excavation, the photo ionization detector (PID) registered high VOC readings in the northwest corner with a strong petroleum odor. The excavation was extended in this corner to address the petroleum contamination and an additional 1.5 truck loads were removed. Subsequently, 9 samples (6 wall and 3 bottom) were collected for SVOCs analysis, and 4 of these nine samples were also analyzed for VOCs. Residual VOC (0.14 to 0.36 ppm) and SVOC (non-detect to 2.2 ppm) levels were low relative to the other locations across the site.

7.5 Excavation Water Treatment and Disposal

Excavation of the soils resulted in groundwater exfiltration into the excavation. The excavation water was pumped into two 20,000 gallon storage tanks where the solids were allowed to settle over a period of several hours. The excavation water in the tank was then pumped through an on-site treatment consisting of two parallel trains, each with two bag filters and two activated carbon canisters in series. The treated water was discharged into the sanitary sewer.

The pumping rate was initially kept at 20 to 30 gpm based on the rated capacity of the carbon drums. During periods of high water levels in the excavation, the water was pumped at a higher rate (up to 100 gpm) with approval from the Erie County wastewater treatment plant. Over the course of excavation, an estimated 573,000 gallons of water was pumped out of the excavation and discharged into the sanitary sewer.

A permit (included in Appendix I) was obtained from Erie County prior to the discharge, and the treated water was sampled periodically to confirm that it met the permit requirements for discharge. Analytical results for the excavation water are included in Table 9. While total VOCs in the raw (untreated) excavation water ranged from 0.034 to 0.289 ppm, only trace levels of VOCs (non-detect to 0.086 total) were present in the discharge. At these concentrations, the discharge to the sanitary sewer would have had no noticeable impact on the County's wastewater treatment plant.

7.6 UST Removal

During the course of soil excavation in Area A, two underground storage tanks (one 3,000 gallon and the other 500 gallon) were unearthed. The tank contents were pumped out by a vac truck and disposed of off-site. After that, the tanks were cleaned, cut and taken off-site to a recycling facility. Disposal records for the USTs and their content are included in Appendix J.

7.7 Backfill

The excavation was backfilled with clean fill materials from off-site - silty clay (approximately 90 loads) and shot rock (9 loads) from the Buffalo Crushed Stone Quarry in Clarence, NY, and bank-run gravel and crusher run (25 loads) from Mathias, NY. Analytical data for the off-site fill are included in Appendix K. Some backfill also came from the excavation onsite from the top foot in Area C (see Drawing 4), and from depths greater than 4 feet in the new UST location for the gas station. Two other off-site sources were tested and found to have unacceptable levels of semivolatile organics and other contaminants. After backfilling, the site was regraded and prepared for its development as a gas station.

7.8 Summary of Interim Remedial Measure

The Interim Remedial Measure was carried out over three months from July to September 2004. A total of 5,908 tons of soil was excavated from four distinct areas on the site based on petroleum and/or SVOC contamination. The excavated soils were disposed as non-hazardous waste at the Tonawanda Landfill. During soil excavation, approximately 573,000 gallons of groundwater draining into the excavations was collected in storage tanks and treated with bag filters and activated carbon drums prior to discharge into the sanitary sewer. Two petroleum USTs (3,000 and 500 gallons) were uncovered during the excavation and were properly cleaned and disposed off-site at a recycling facility. The excavated areas were backfilled with clean off-site fill and on-site soils excavated during the new UST installation and from the surface of Area C.

The objectives of this remedial measure have been met with the excavation of soils with petroleum contamination as well as SVOC hot spots that appear to be related to this area's historical industrial background. The residual soil contamination at the site slightly exceeds the TAGM-4046 SCOs, and as a result, the unrestricted use option is not appropriate for this site. However these areas have been covered with asphalt pavement. Surface water is diverted through drainage swales around the property boundary into the storm sewer. The removal action and the site preparation, as well as the fact that this property is located on a major traffic route, make it suitable for its intended future use as a commercial establishment (i.e. as a gas station).

8.0 O&M AND LONG-TERM MONITORING

No long-term monitoring is required at the site given the very low level VOCs in the groundwater at the site and the fact that the source of the contaminants have been removed and disposed off-site.

9.0 INSTITUTIONAL CONTROLS

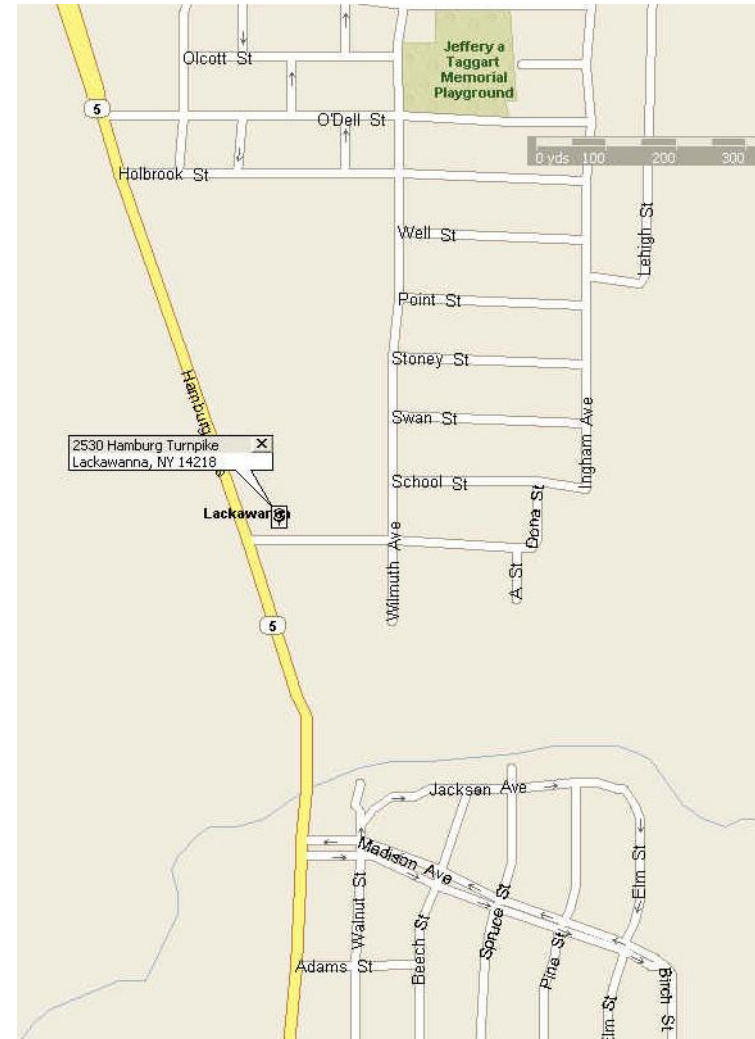

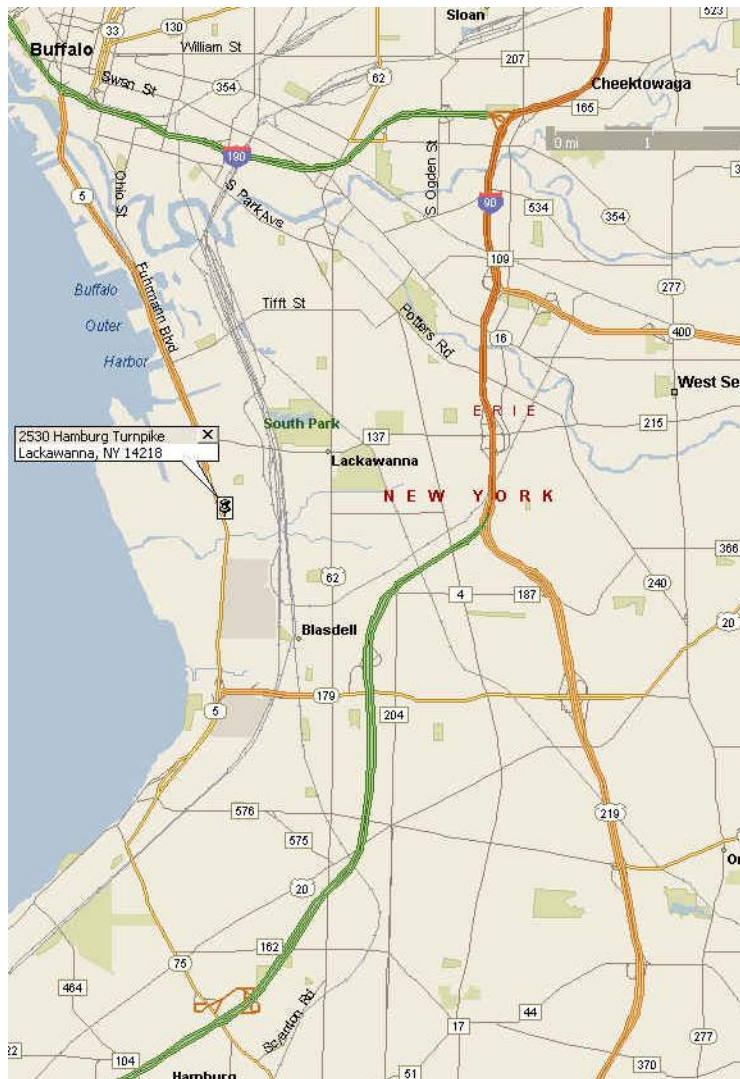

The results of confirmatory soil sampling show that the remediation goals have been met for the site. Based on these results and the qualitative risk assessment, and taking into consideration the presence of low level residual contamination associated with past industrial practices in the area, it appears that the site is not readily suitable for unrestricted use. The fact that the property is located on a major traffic route will by itself limit the site use for commercial purposes. The asphalt cover will be maintained to prevent any contact with the underlying residual soil contamination.

NOTES:

INTERIM REMEDIATION PLAN:

- SPECIFIC AREAS OF CONTAMINATED SOIL EXCAVATION WILL BE AS FOLLOWS (OR AS DIRECTED IN THE FIELD BY THE ENGINEER/NYSDEC):
 - AREAS MARKED D AND E WITH KNOWN SVOC CONTAMINATION WILL BE EXCAVATED TO DEPTHS OF 2 TO 4 FEET FIRST, AND THEN BACKFILLED WITH CLEAN FILL.
 - AREA B WITH VOC/SVOC CONTAMINATION WILL BE EXCAVATED TO A DEPTH OF 2 TO 4 FEET TO ALLOW ACCESS TO AREA A.
 - AREA MARKED A WITH VOC CONTAMINATION WILL THEN BE EXCAVATED IN INCREMENTS BASED ON FIELD PID SCREENING AND CONFIRMATORY SAMPLING FOR VOCs.
 - THE TOP 8" TO 12" FROM THE REMAINING AREA WILL BE EXCAVATED FOR USE AS BACKFILL.
- THE EXCAVATIONS WILL BE BACKFILLED WITH CLAY BELOW 8 FEET DEPTH, AND WITH CRUSHED CREEK GRAVEL FROM A KNOWN OFF-SITE SOURCE AND ON-SITE MATERIAL ABOVE 8 FEET DEPTH.
- THE FOUR NEW MONITORING WELLS WILL BE RETAINED FOR POST-REMEDATION MONITORING. EXISTING PIEZOMETERS WILL BE ABANDONED AFTER COMPLETION OF THIS REMEDIAL ACTION.

APPENDIX D

**SITE PHOTOS
INTERIM REMEDIAL ACTION**

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 07/31/05

MARKING EXCAVATION AREAS

The east border of Area A is near the west edge of the asphalt parking lot

The stake marks the northeast corner of Area B

The orange mark at the bottom of the photo is the east border of Area B

The stake marks the southeast corner of Area D

Northeast corner of Area D

Area E is located at the driveways entering from Dona Street

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/07/05

PERIMETER FENCE

Fencing
begins at
the
northwest
corner

The
north
border
of the
site

Preparing
to fence
along the
western
border

Looking
north
along the
Hamburg
Turnpike

The fence nears completion at the southeast
corner

At the end of the day, the fence is rolled out
across the driveway to close off the job site

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/07/05

EXCAVATION BEGINS

The HITACHI EX 120 moves a brush pile out of the way to begin excavating Area D

A Bobcat skid steer arrives at the job site

The Skid Steer pushes debris out of the way and knocks down the vegetation

A Bobcat excavator is brought in when the HITACHI needs repair work

Area D is the first to be excavated

The excavator loads one of the first of many Dump Trucks to come

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/07/05

EXCAVATION OF AREA D

After excavating the northeast extension of Area D, PITD starts on the west border

It soon becomes apparent that old structures may have been buried in place

Buried metal and bottles were frequently encountered

Piles of bricks were discovered

There had been a Gas Station on the west border of Area D and various underground pipes were found

Two metal pipes can be seen below the concrete pad that had to be excavated

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/14/05

EXCAVATION ENDS AT AREA D

Northeast extension of Area D is finished

Another load from Area D

The last of Area D being excavated

A ramp is made in the southeast corner to access the bottom

Skid Steer smoothing out the bottom

Finally the bottom is tamped

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/14/05

TREES ALONG DONA STRET

Eastern
most Tree
along
Dona
Street

Second Tree
from the
east. A little
drought
related
stress is
evident

The middle
tree exhibits
more
drought
related die-
back

Note
pronounced
dieback on
fourth tree

Western
most tree
is also
severely
stressed

View of
the row of
trees

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/14/05

EXCAVATION OF AREA E

Excavation begins on the east border of Area E

Southeast corner of Area E

The digging continues to the west

When the larger excavator is repaired, the pace picks up

Area E looking westward

PITD takes care when digging around MW-2 at the southwest corner of Area E

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/14/05

BACKFILLING AREA E

Bank Run Gravel is delivered ...

... and moved to Area E

A ramp is made in the northwest corner to access the bottom

After the bottom is tamped, the gravel is pushed in

Lines are painted on the walls 1' apart. The gravel will be added and tamped intermittently.

The west half of Area E is brought up to Area C grade so that one of the driveway entrances can be used

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

EXCAVATION OF AREA A BEGINS

Immediately old pipes and wires are encountered

The first of many Area A loads is readied for transport

The excavation is started at the south end of Area A and progresses north

The hole begins to fill with water once 12' is reached

Another tandem dump truck backs up to be loaded

MW-3 at the south end of Area A. Several yards distance was kept around the light pole to maintain stability.

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

FIRST CLAY DELIVERY

Loads of clay
are delivered
for backfilling
Area A

The clay is
found to be
contaminated

The loads are
immediately
hailed away

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

MOBILIZING BAKER TANK

The top 1' of Area C along the eastern border is scraped away in preparation for the Baker Tank

The area is then tamped

Maneuvering the Tank into place

The Tank parked next to Albright Court

A submersible pump is dropped into the hole in Area A. The water hose runs across the asphalt parking lot to the Baker Tank.

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

OVERVIEW

Looking east to west on the south side of the job site

Looking north from Dona Street at the entrance to the job site

A view from the top of the Baker Tank looking west across the middle of the site

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

EXCAVATING UST - 1

A UST is discovered on the east border of Area A

Underground pipes were attached to the Tank

C & W Environmental arrives with the vacuum truck

Pumping out contents of UST - 1

Excavating the UST

A freshly pulled UST - 1

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

CONTINUING EXCAVATION OF AREA A

The excavation progresses northward along the western border of the site

Small pipes are encountered just north of where UST – 1 was pulled

Always,
groundwater
must be
pumped out
of the hole

View of
hole
looking
south

Massive concrete and metal pieces are encountered on the north side of Area A

Moving the debris away from the hole

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

CLEANING UST - 1

Close view of UST-1

Holes were corroded right through UST-1

Sawing the ends off of the UST

Suiting up to enter the UST

View of cleaned Tank

View inside of Tank

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/21/05

BROWNFIELDS SIGN

Comet Flasher, Inc. erects a "Brownfields Cleanup Program" sign on the site

The sign is located near the northwest corner of the property

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/28/05

WATER TREATMENT

Top of Baker Tank showing hose that conveys the water from Area A

Close-up of water hose inside of Tank

The Water Treatment System: (1) bag filter and (2) carbon drums

The treated water is discharged into the Sanitary Sewer at the southeast corner of the job site

As the excavated area gets larger, a second Baker Tank is mobilized

View of the Baker Tanks and Water Treatment System

FINISHING AREA A

PITD excavator puts dam in hole to separate the water muddied from digging and the water being pumped out

A momentary break to fuel the equipment

View from north looking south

Looking south from inside the hole

PW-1
about to
be pulled
out

Shallow
dig to the
left of the
hole is
Area B

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/28/05

EXCAVATION OF AREA B BEGINS

Asphalt being dug up near the south end of Area B

Northeast corner of Area B

Concrete and steel moved to northwest corner of property

Excavated top of PW-1

View of Area A/B from northwest corner of Area B

Excavator scraping down to the bedrock at the bottom of the hole

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/28/05

ADDITIONAL EXCAVATION - AREA D

Lab tests confirm two “hot spots” in Area D. One is the northeast extension shown here.

The other “hot spot” is the northwest corner

Both areas are excavated ...

... and tamped again.

View of Area D
looking from the
west side of the
job site

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 08/28/05

EXCAVATION OF AREA B

Looking south over Area B

North side of Area B

Overview of Area A/B

Looking south over Area A/B

The large excavated area now fills with a substantial amount of rain and groundwater

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/04/05

UST-2

A UST of approximately 550 gallons is uncovered

The UST is badly corroded and its contents (mostly water) spill down into the bottom of Area A

UST-2 is pulled out

Water pumped from Area A is used to clean UST-2. The water runs back down into the hole.

There is a concrete footing where the UST was buried

Another view of the cleaned Tank

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/04/05

THE RAINS COME!

View of Area A/B. Note mostly dry hole.

Before the rain

After the rain

Even Area
D was
filled with
water for
the first
time

PITD pumped water from Area D into Area A/B

Then pumped the diluted water (mostly rainwater) directly into the Sanitary Sewer

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/04/05

BACKFILLING AREA D

Dump Trucks bring in loads of clean fill

The bulldozer pushes fill into Area D

Rainwater is pumped out of the northeast extension ...

... and out of the west end.

Area D mostly filled in

Another view from the top of a Baker Tank

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/04/05

EXCAVATING SOUTH END OF AREA A/B

View of job site taken south of Dona Street

Area A/B and the intersection of the Hamburg Turnpike and Dona Street

Digging around MW-3 at the south end of Area A

Loading a truck at the south end of Area A

This area is quickly backfilled to prevent losing the stability of either MW-3 or the Traffic Light Pole

Finally the south end of Area B is excavated

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/11/05

EXCAVATING PRODUCT PLUMES IN AREA B

Vertical stripe on wall designates the north border of Area A. Slow seeps with product sheen are found in Area B (slope on right)

Earth dam on left keeps groundwater out while “plumes” are excavated

Excavation continues while IEG samples the soil

A sump pump in Area A keeps the water in the hole low

Sample digs conclude that the “plumes” have been excavated

Area A/B can now be backfilled

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION

PHOTOS – WEEK ENDING 09/18/05

BACKFILLING AREA A/B BEGINS

Large pieces of rock and concrete are placed at the bottom of the hole.

Load of shot rock being delivered

Pile of shot rock will be pushed over the large pieces of concrete at the bottom of the hole

Backfilling starts at the south end of Area A/B and progresses to the north

Large pieces of concrete are pushed into the bottom

Bulldozer pushing shot rock into hole

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/18/05

BACKFILLING AREA A/B

After all the rock is spread, loads of clean clay fill arrives in Tandem Dump Trucks...

...and Dump Trailer Trucks

The bulldozer pushes the clay into the south end...

...and the north end.

The material is rolled intermittently...

...for compaction.

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/25/05

FINNISHING THE BACKFILL

View of the New Tank Area on the northwest end of Area B. Note pile of newly excavated material.

Acome Construction excavates for the new USTs

New Tank Area excavated material is piled next to the hole...

...then pushed into Area A/B and rolled.

The top of Area C is loaded into the dump truck to be spread into Area A/B

The last of the New Tank Area material is loaded up to be dumped into Area A/B

2530 HAMBURG TURNPIKE SITE – BROWNFIELDS REMEDIATION
PHOTOS – WEEK ENDING 09/21/05

END OF REMEDIATION

View across middle of the job site at northeast corner after Area C has been excavated

The New USTs are in the hole

Looking toward the southwest corner of the site. Note that asphalt has been excavated

Facing east along the northern border of the property. All of Area C has been excavated.

Facing north on the east side of the site. Albright Court is on the right side.

Southeast corner of the property

WATER TREATMENT	BAKERS TANK 21K - 1/2 filled
REMARKS/NOTES	Tom M. - stage (1) load of Area A material for mixing with spent carbon. Linda R. - OK to put UST sludge into Area A material.
PLANNED/SCHEDULED ACTIVITIES	Continue excavation Areas A & B Start treating water in Baker Tank

INSPECTOR'S DAILY REPORT

PROJECT 2530 HAMBURG TURNPIKE BROWNFIELDS SITE REMEDIATION LACKAWANNA, NY Contractor: PTD Engineer: Iyer Environmental Group, PLLC.
--

DATE: Aug 19, 2005

Day of Week:

S	M	T	W	T	F	S
					✓	

Inspector time: 7:30 to 4:30

Contractor time: 7:00 to 4:30

WEATHER: Rain to Sunny

TEMPERATURE: Warm

WIND: Strong S-wind

Security: _____ to _____

EQUIPMENT ON SITE	Brodies Truck 818	Mawhiney Truck DMT-1
	Brodies Truck 816	Lukowski Environmental Services Truck
PERSONNEL ON SITE	Ray Lukowski	Jim Mendola (Southtowns/Sewer)
	Tom Biel (DEC)	Brian Graber (DEC)

WORK PERFORMED:

MOBILIZATION	Water Treatment Samples taken to Lab. (1) Influent and (1) Discharge	
EXCAVATION	Area A - north - A lot of large concrete chunks including gas station islands slow up excavations. Much metal is found too.	Area B - started on north end of Area A. Plans to make a ramp here to get to the bottom of Area A.
STOCKPILE		
TRANSPORTATION/ DISPOSAL	(10) Loads from Area A depart (1) Load from Area B depart	SOIL QUANTITY Day: <u>11</u> / <u> </u> Cur: <u>14</u> / <u> </u>
RESTORATION		
USTs	Ray Lukowski cuts both ends off of UST-1. Only approximately 2 lb of material inside.	UST-1 is moved to south border of property.
WATER TREATMENT	Jim Mendola - dump into Sanitary Manhole SE corner "Must call 823-5000 when you pump." Pump 10 gpm maximum	Southtowns/Sewer tests treatment rate and says we are good.
REMARKS/NOTES	Frank Mathews - concerned about groundwater travel to construction excavation.	Dharma - Water Treatment Lab sample every 10,000g Field sample every 2500g
PLANNED/SCHEDULED ACTIVITIES	Treat water in Baker Tank. Continue to excavate Areas A & B

EQUIPMENT ON SITE	LCA Development Trucks L51, L52, L77, L99, L53 Artweiler Trucks A60, A59, A32, A48, A54	BAKER TRUCK 250, 684 BAKER TANK 1 (5116ST)
PERSONNEL ON SITE	Frank Matthews	

WORK PERFORMED:

MOBILIZATION	(39) Loads of clay fill delivered (32) Loads of clay delivered by Tandem Dump (7) Loads of clay delivered by Dump Trailer	(E) Loads of shot rock delivered	BAKER TANKS departed with 5116ST Both Tanks have departed site
EXCAVATION			
STOCKPILE	(1) Load of material from Area B stockpiled on plastic near MW-1.		
TRANSPORTATION/ DISPOSAL			SOIL QUANTITY Day: <u>0</u> / Cum: <u>257</u>
RESTORATION	Acme Cstr. - pushes delivered shot rock and clay into Area A/B. Clay is filled in 9' below grade before any rolling is done.		
USTs			
WATER TREATMENT	PITD pumps (4) drums of waste water from cleaning BAKER TANKS through carbon drums into sanitary sewer. Pumps (1) drum of PW water.	Area B - water collects in "hot spot" as Area A is filled. Pumped directly into sanitary sewer; no filter.	PITD empties (4) carbon drums onto stockpiled material from Area B.
REMARKS/NOTES	Sewer District manager call when we are done pumping water.		
PLANNED/SCHEDULED ACTIVITIES	Excavate for new Tanks Haul out stockpiled load.

EQUIPMENT ON SITE	AZZ Rental Truck DYNAPAC Roller
PERSONNEL ON SITE	Frank Mathews

WORK PERFORMED:

MOBILIZATION	CEW Envr. - cleans and departs (10) drums. AZZ Rental delivers DYNAPAC Roller
EXCAVATION	
STOCKPILE	Stockpiled Area B material is transported
TRANSPORTATION/ DISPOSAL	<div style="display: flex; justify-content: space-between;"> <div> (1) Load departs Area B (97) Loads TOTAL Area B </div> <div style="text-align: right;"> <u>SOIL QUANTITY</u> Day: <u>1</u> / <u>1</u> Cum: <u>255</u> / <u> </u> </div> </div>
RESTORATION	Material from New Tank excavation below 4' is spread into Area A/B. (Mostly silty clay and clay) PTD uses new Roller to compact material
USTs	Aceme Centre. excavates area for New Tanks. Ground water enters new excavation.
WATER TREATMENT	No water pumped today
REMARKS/NOTES	Dharma - put excavated clay into Area A/B. - A/B excavated top 4' - Add Area C material Dharma - water in New Tank excavation must be pumped through bag filters.
PLANNED/SCHEDULED ACTIVITIES	Continue to excavate for New Tanks Pump water from New Tank hole

PERSONNEL ON SITE	King Oil Truck	Ball Septic Truck	
	Brian Graber (DEC)	Frank Mathews	Linda Ross (DEC)
	Ray Lukowski	Kevin McDonald (CWE)	Mike Wrobel (CWE)

WORK PERFORMED:

MOBILIZATION	SAMPLES - INF-2, DIS-2 DELIVERED (2) BAKER TANKS - DB-1-B, DW-5-B			IEG - marks (2) additional Area D "hot" spots.
EXCAVATION	Area A - Concrete & steel encountered at north end. Moved to NW corner.			Area D - "hot" spots excavated. Area B east excavated.
STOCKPILE				
TRANSPORTATION/ DISPOSAL	Area A TOTAL (58) Area B TOTAL (26)	Area C TOTAL (-) Area D TOTAL (40.5)	Area E TOTAL (21.5)	TOTAL LOADS DEPARTED 177
SITE RESTORATION				
WATER TREATMENT	PITD sets up Water Treatment System (1) Bag Filter, (2) Carbon Drums. Sets up 2nd identical system.			Pump water from Area A into Baker Tank. (2) Baker Tanks on site. Pump soaked water through Treatment System. Treated - approx 39,000g
NOTES	Dharma - Pump water into one BAKER TANK Treat water out of other BAKER TANK			
ACTIVITIES NEXT WEEK	Continue to Pump and Treat Area A water Continue to excavate Area B			

WEEK ENDING: Sep 4, 2005

WEEKLY PROJECT SUMMARY

<u>PROJECT</u>
2530 HAMBURG TURNPIKE BROWNFIELDS SITE REMEDIATION LACKAWANNA, NY Contractor: PITD Engineer: Iyer Environmental Group, PLLC.

EQUIPMENT ON SITE	Mawhiney Truck DMT-1 Pariso Trucks 223, 165 Onieda Truck 005	BAKER TANKS S116ST, S2564EA Brodie's Trucks 816, 818 Serafini Trucks S54, S25, S76, S79, S80, S81
PERSONNEL ON SITE	James Butki (Buffalo Hauling Corp.) Frank Matthews Linda Ross (DEC)	Ray Lukowski Martin Dester (DEC)

WORK PERFORMED:

MOBILIZATION	SAMPLES - AW-5, AW-6 Area A Dimensions: Area A borders marked by JEG Roller delivered AW-7 - INF-3, DIS-3 24' 96 45 AW-8 - TANK 4, DIS-4 102		
EXCAVATION	Area A/B - work continues until slowed by rain. Resumes again		
STOCKPILE			
TRANSPORTATION/ DISPOSAL	Often the Dump Trucks arrive with 15 minutes of each other when this happens they have to wait to be loaded. Area A TOTAL (96) Area E TOTAL (21.5) TOTAL LOADS DEPARTED 230 Area B TOTAL (72) Area D TOTAL (40.5)		
SITE RESTORATION	Clay Fill at Buffalo Crush stone is OK. Area D about half filled in.		
USTs	UST-2 uncovered Area B center. Many holes corroded through. Label gone. Approx. 550 g. 67" x 47" D. PITD digs more material from UST-2 site after high PID readings.		
NOTES	Tom - should let Fill dry before rolling Area D.		
ACTIVITIES NEXT WEEK	Continue to pump water out of Area A Finish excavating Areas A/B		
WATER TREATMENT	Area A water in hole is diluted by rainwater from yesterday. Dharma cks pumping into sanitary sewer temporarily. Water from Area D pumped into Area A. Toward end of week's water from Area A is pumped through bag filter into sanitary sewer Approx 45,000 g pumped through BAKER TANKS		

WEEK ENDING: Sep 11, 2005

WEEKLY PROJECT SUMMARY

<u>PROJECT</u>
2530 HAMBURG TURNPIKE BROWNFIELDS SITE REMEDIATION LACKAWANNA, NY Contractor: PITD Engineer: Iyer Environmental Group, PLLC.

EQUIPMENT ON SITE	Brodies Truck 816 American Transport, Inc Flatbed Trailer C. Parise Trucks 195, 199, 202 Turn o'Donnell Trucking, Inc Flatbed Trailer Link Belt Crane 2754 D. Parise Trucks 104, 101, 102 Bell Septic
PERSONNEL ON SITE	Frank Matthews Linda Ross (DEC) Ray Lukowski

WORK PERFORMED:

MOBILIZATION	SAMPLES - BB-1, BB-2, BB-3, BW-1 BW-2, BW-3, BW-4, BW-5, AINFL-5, A DIS-5, BW-6, BB-4, BB-5 (2) XERXES Fuel Tanks delivered		
EXCAVATION	IEG discovers product in plumes trickling out from Area B, with PID readings are high.	Excavation to remove plumes in NW Area B goes down to bedrock.	IEG takes PID readings continuously as PITD excavates plume area. All perimeters are chased until PID readings are low, or we encounter west border.
STOCKPILE	(6) Loads Bank Run Gravel delivered to Area D	(1) Load of Area B material is stockpiled on plastic in Area C, center. This load will be used to mix with BAKER TANK sludge and spent carbon from drums.	
TRANSPORTATION/ DISPOSAL	Area A TOTAL (96) Area B TOTAL (96)	Area D TOTAL (40.5) Area E TOTAL (21.5)	TOTAL LOADS DEPARTED 254
SITE RESTORATION	Area D filled with bank run Gravel and rolled.		
WATER TREATMENT	Both Baker Tanks drained through bag filters until empty.	Most water entering Area A is from springs at surface of bedrock. Entering water is very clear.	Water in Area A is being pumped directly in sanitary sewer. No filtration. Over 150,000 gals pumped from Area A this week
NOTES	Linda Ross (DEC) - satisfied that Area B "hot" spot was completely excavated.		
ACTIVITIES NEXT WEEK	Fill Area A Pump water from Area A		

WEEK ENDING: Sep 18, 2005

WEEKLY PROJECT SUMMARY

PROJECT 2530 HAMBURG TURNPIKE BROWNFIELDS SITE REMEDIATION LACKAWANNA, NY Contractor: PJTD Engineer: Iyer Environmental Group, PLLC.

EQUIPMENT ON SITE	C&W Envir. Equip Truck C&W Envir. Vacuum Truck BAKER TANKS 1&2 B.F.S. Services Tandem Dump Truck C. Pariso Tandem Dump Truck Rodgers Welding Supply/Truck DYNAPAC Roller
PERSONNEL ON SITE	Frank Matthews Mike Wrobel (C&W E) Derek Clendenning (C&W E) Johnny Elberry (C&W E)

WORK PERFORMED:

MOBILIZATION	Delivered - (4) Loads shot rock (39) Loads of clay DYNAPAC Roller Loads Fea Gravel Departs - BAKER TANK S2564 EA BAKER TANK S1165 T (10) Metal Drums PJTD Roller
EXCAVATION	Acome Contr. excavates New Tank Area. Material is pushed on Area A/B and rolled. Cast concrete anchors are set at bottom of excavation. Acome C. finishes excavating New Tank Area.
STOCKPILE	(1) Load material from Area B put on plastic
TRANSPORTATION/ DISPOSAL	Stockpiled Load is transported. Area A - (95) Area D - (40.5) TOTALS: Area B - (97) Area E - (21.5) TOTAL LOADS TRANSPORTED <div style="border: 1px solid black; padding: 2px; display: inline-block;">255</div>
SITE RESTORATION	Area A - Large concrete chunks pushed into bottom, then covered with shot rock. Acome Ctn pushes shot rock into Area A/B. Then pushes clay in and rolls intermittently New Tank Area - excavated material below 4' is spread and rolled in Area A/B
USTs	Jim Acome excavates New Tank Area on North west of Area B. Groundwater enters New Tank Area. The water seeps in just above bedrock and is very clear.
NOTES	IEG, PJTD, Acome - try different methods of pumping water from New Tank Area through bag filters. The high turbidity of the water, due to continuing excavation, clogs up the filters. At 1:00 PM Frank disconnects bag filters and pumps directly into storm sewer on Albright Court.
ACTIVITIES NEXT WEEK	Instal New Tanks into New Tank Area.
WATER TREATMENT	C&W Envir. crew cleans both BAKER TANKS. Sludge from TANKS goes onto stockpiled Area B material. (4) drums of waste water collected. Electric Pump runs continuously in Area A, Pumping into sanitary sewer. No filter. Groundwater entering hole is very clear. Carbon Drums - used to filter (4) waste water drums. Then, spent carbon dumped onto stockpiled Area B load.

WEEK ENDING: Sep 25, 2005

RE: Erie County Sewer District No. 6 (ECSD No.6)
2530 Hamburg Turnpike
Discharge Request

Dear Mr. Iyer:

The Division of Sewerage Management (DSM) has received and reviewed your discharge request for treated water at the corner of Route 5 and Dona Street. The water is from contaminated soils excavation and will be treated with two activated carbon drums in series. The request to discharge between 10,000 – 30,000 gallons of treated water as described in the request is approved based on the following conditions:

1. Notification to the Erie County Sewer District No. 6 (ECSD No.6) treatment plant must be provided at least twenty-four (24) hours prior to discharge. The telephone number is 823-5800.
2. The flow shall enter the sanitary sewer system at the discharge point designated by ECSD No.6.
3. The ECSD No.6 treatment plant shall be provided with the name and number of a person to contact, if necessary, during the discharge. This information may be provided at the time a permit is issued.
4. A District representative shall be present upon initiation of discharge.
5. The rate of discharge shall remain at 10 gpm as described in the request.

D. R. Iyer
July 25, 2005
Page Two

6. If at any time a problem arises in the collection system as a result of the discharge the District may require that operations cease.

To obtain the permit to discharge, please bring this letter with payment to the ECSD No.6 office. The office is located at 260 Lehigh Avenue in Lackawanna. A check or money order for \$579.20 made payable to the Erie County Director of Budget and Finance will cover the \$402.00 permit and inspection fee, along with the flow charge of \$177.94.

If you should have any questions or concerns, please contact me at 858-8756.

Very truly yours,

Nicole J. Elliott

13. Discrepancy Indication Space to be Completed by the Disposal Facility.			
14. Discrepancy Indication Space to be Completed by the Disposal Facility.			

**INSTRUCTIONS FOR COMPLETION
STRAIGHT BILL OF LADING/NON-HAZARDOUS WASTE MANIFEST**

SECTION 1: GENERATOR INFORMATION - Generator Name, Mailing Address, and Telephone No.: Self-explanatory
Site Address: Generator site address if different from mailing address, if same write "SAME".

SECTION 2: Destination Disposal Facility Information: Complete the company name and site address of final destination point. Include telephone number with area code.

SECTION 3: TRANSPORTER INFORMATION - Transporter 1: Complete Company Name and Telephone No.; Self-explanatory. License Plate No. Enter the license plate number of the waste hauling portion of the vehicle, including the state the vehicle is registered in.

Transporter 2: Complete information for Transporter Two if a second transporter or a second vehicle is used to move the material. This section does not need to be completed if a second driver operates the same vehicle. License Plate No.: Enter the license plate number of the waste hauling portion of the vehicle including the state the vehicle was registered in.

SECTION 4: MATERIAL/WASTE DESCRIPTION - Container Number: Indicates the number of each type of container used, in whole numbers.
Container Type: Indicates the container type abbreviation: DM - Metal drums, barrels; DT - Dump Trucks; DW - Wooden drums, barrels; CY - Cylinders; DF - Fiberboard or plastic drums; CM - Metal boxes, cases, roll-off; TT - Cargo tank, tank trucks; CW - Wooden boxes; TP - Tanks, portable; CF - Fiber or plastic boxes, cartons; BP - Burlap, plastic, paper bags. **HM:** Place an X in this section if the material is DOT "Hazardous Material". If it is not, leave this section blank.

Material Description/Proper Shipping Name if DOT Hazardous Material: If DOT Hazardous, enter the proper shipping name, obtained from Column 2 of the Hazardous Materials Table. If not DOT Hazardous, enter an accurate description of the material.

Hazard Class: The hazard class corresponds to the proper DOT shipping name; consult Column 3 of the Hazardous Materials Table. If the material is not DOT Hazardous, enter "Non-hazardous".

ID Number: This is the DOT Identification Number, corresponding to the proper DOT shipping name; it is either an UN or NA Number. Consult Column 4 of the Hazardous Materials Table, and always include either the UN or NA prefix, whichever is indicated in the Table. Enter the word "None" if the material is not DOT hazardous.

Packing Group: The Packing Group Number corresponds to the property DOT shipping name. Consult Column 5 of the Hazardous Materials Table. Enter "N/A" if the material is DOT non-hazardous.

Total Weight/Volume: Enter the total weight or volume of the material and the units of measurement, pounds or tons for weight of a solid, gallons or liters for volume of liquid.

Weight/Volume Unit: Enter the weight or volume per unit of material, include the units as indicated above, P - Pounds; G - Gallons; L - Liters; Y - Cubic Yards; T - Tons; K - Kilograms; M - Metric Tons; N - Cubic Meters.

SECTION 5 - Job Number: Enter the Internal job number assigned.

SECTION 6 - Approval Number: Enter the approval number assigned to the material by the disposal facility, if applicable.

SECTION 7 - Purchase Order Number: Enter the purchase order number assigned to the job, if applicable.

SECTION 8 - Additional Information: Use this space to note any additional information.

SECTION 9 - List placards required, if any.

SECTION 10: GENERATOR CERTIFICATION - This section must be read, certified to be correct, signed, and dated by an authorized representative of the generator.

SECTION 11: ACKNOWLEDGMENT OF RECEIPT OF MATERIAL - Transporter 1: Driver Signature, Shipment Date: Self-explanatory.
Transporter 2: To be completed if a second transporter was used.

SECTION 12: Disposal Facility Accepting Waste: Authorized Agent, Agent Signature, Date: Self-explanatory.

SECTION 13: EMERGENCY TELEPHONE NUMBER - When C & W Environmental is the transporter, enter the telephone number for the Corporate Office (716) 597-0001 and the Environmental Coordinator's name, otherwise, enter the telephone number and name of someone knowledgeable about the material being transported.

SECTION 14: DISCREPANCY INDICATION SPACE: The authorized agent of the disposal facility accepting the waste must note in this space any discrepancy between the material described on the Bill of Lading and the material actually received at the disposal facility. Any rejected materials should be listed and the destination of those materials identified.

Mr. Mike Diamond
Hurwitz Company, Inc.
267 Marilla St.
Buffalo, NY 14220

RE: Certificate of cleaning of USTs prior to cleaning

Dear Mr. Diamond:

Two steel underground petroleum storage tanks (one 3,000 gallon and the other 500 gallon) were removed this month from the 2530 Hamburg Turnpike property during site remediation under the Brownfields Cleanup Program with NYSDEC oversight.

This is to certify that the two tanks were cleaned on site and should be suitable for recycling.

Please call me if you have any questions or need additional information.

Sincerely,

IYER ENVIRONMENTAL GROUP, PLLC

Dharmarajan R. Iyer, Ph.D., P.E., CES

ANALYTICAL DATA FOR OFF-SITE BACKFILL

MICHAEL SERAFINI, INC.
TRUCKING AND EQUIPMENT
3529 Broadway
Cheektowaga, NY 14227

ANALYTICAL DATA FOR BACKFILL FROM QUARRY

Speed Memo

To: Dominic Smith
From: Douglas H. Ruszky
Re: BACKFILL SOIL ANALYTICAL DATA

Date/Time: 1/25/02
Job No.: 778.11.085
Project: #7 BEAN METAL/UNIVERSAL METAL

Message:

I HAVE REVIEWED ANALYTICAL DATA RECEIVED FOR BACKFILL SAMPLE BCS-02 FROM BUFFALO TONER SOIL QUARRY IDENTIFIED BY CDA. THE VOLATILE DATA INDICATE NON-DETECTABLE CONCENTRATIONS, EXCEPT FOR TWO HYDROCARBONS (BENZENE & METHYLENE CHLORIDE) WHICH DETECTED IN A LABORATORY BLANK AT SIMILAR CONCENTRATIONS. THE SEMI-VOLATILE (PAHs, PCBs, PESTICIDE AND HERBICIDE) ANALYTICAL DATA WERE ALL NON-REPORTED AT NON-DETECTABLE CONCENTRATIONS. THE METALS DATA REPORTED ARE LESS THAN 10% OF 4045 SOL, EQUAL LEAD AND/OR COMPARABLE TO AREA SOIL BACKFILL CONCENTRATIONS. THEREFORE THIS SOIL IS SUITABLE FOR USE AS BACKFILL FOR THE BEAN METAL/UNIVERSAL SITE BASED ON ANALYTICAL DATA REPORTED BY STL (ATTACHED).
