1.0 INTRODUCTION

Roux Associates, Inc. and its associated engineering firm Remedial Engineering, P.C. (collectively referred to herein as Roux Associates) has prepared this Completion Report to document the remediation activities for the closure of the former Main Inground Oil/Water Separator (Separator). The work was performed in the Former Refinery Area (FRA) at the ExxonMobil Buffalo Terminal, Buffalo, New York (Site) located at 625 Elk Street, Buffalo, New York (Figure 1). The FRA is one of the nine geographic areas the Site has been divided into for the purpose of assessing environmental conditions and reporting the results of area-specific activities (Figure 2). The remediation activities for the closure of the Separator (Figure 3) were performed from October 22 through November 25, 2002. This work was completed in accordance with the Work Plan for Closure of the Main Inground Oil/Water Separator (Work Plan), dated August 5, 2002 (Roux Associates, 2002).

The remedial activities implemented for the closure of the Separator included, but were not limited to:

- Dewatering of the Main Inground Oil/Water Separator and subsequent water treatment;
- Excavation, dewatering, stabilization and stockpiling of the semi-solids;
- Scraping of walls and floors using the excavator;
- Sealing of pipe openings in the Separator walls/removal of debris;
- Transportation and off-Site disposal of the excavated material;
- Backfilling and compaction using certified clean fill material, as well as material generated from the ExxonMobil Pipeline Relocation Project located along the former Erie-Lackawanna Railroad property; and
- Site Restoration.

2.0 BACKGROUND INFORMATION

The history of the Main Inground Oil/Water Separator and a summary of investigation activities performed are presented in the following sections. This information presented in this section was obtained from the documents titled "History of Operations at Buffalo Terminal," prepared by Roux Associates, dated April 26, 2000 and "Site Investigation Completion Report," prepared by Roux Associates, dated March 12, 2002.

2.1 Main Inground Oil/Water Separator Description and History

The former Main Inground Oil/Water Separator was constructed between 1917 and 1924 in the southern portion of the FRA and is designated as a Waste Handling Area (WHA). The Separator was used for the separation of petroleum from aqueous waste streams and storm water. The Main Inground Oil/Water Separator measured approximately 260 feet by 103 feet in size, was 16 feet deep and consisted of eight chambers with varying measurements. The Separator collected waste streams from process areas, the Site's Well Point System (WPS) and storm sewers across the entire Site.

From prior to 1924 through 1993, all storm water, cooling water and process water were handled by the Main Inground Oil/ Water Separator. Process water, as well as groundwater extracted by the WPS between 1971 and 1993, was handled in the separator compartment located furthest to the north (Compartment 1). The remaining seven compartments handled all storm water and cooling water, as well as overflow from the first compartment. Between 1977 and 1984, the effluent from the Main Inground Oil/Water Separator was discharged to the Buffalo River under SPDES Permit No. NY-0000264, as discussed below.

Historically, until the refinery demolition occurred between 1988 and 1991, the oil that accumulated on the water in the first compartment (and other compartments, if any) was removed using a vacuum truck and pumped to Tank 40 for storage. As part of the formal closure of the refinery, the eight separator compartments were cleaned in 1981, following Resource Conservation and Recovery Act (RCRA) guidelines and at the direction of the New York State Department of Conservation (NYSDEC) and United States Environmental Protection Agency (USEPA). The waste generated during the 1981 cleaning was disposed off-Site. After the cleaning, Compartment 1 continued to treat process water, cooling water and groundwater from

the WPS. Compartments 2 and 3 continued to accept storm water and overflow of water from Compartment 1. The five remaining chambers were not used. Chamber 1 was cleaned in 1992 and the waste generated was disposed off-Site. The five southernmost compartments were decommissioned in September 1993 by backfilling the compartments with soil from the Biotreatment Cell. The sediment on the compartment floors was mixed with the soil from the Biotreatment Cell.

Between 1973 and 1987/88, the effluent from the first compartment of the Main Inground Oil/Water Separator was treated by a Dissolved Air Flotation Unit. The Dissolved Air Flotation Unit was installed in 1972, and operational by 1973. The unit was no longer used by 1987/88, but was not removed from the Site until 1990, when it was cleaned and dismantled in accordance with RCRA guidelines. The oil and foam from the unit were removed and sent to the Dissolved Air Flotation Float Storage Tank 77. The foam was transported off-Site and the oil was stored in Tanks 40 and 2.

Historical Site drawings indicate that several small inground oil/water separators were located within the collection system to treat flow streams from localized areas of the Site. The flow from small inground separators then discharged into the Site's collection system and ultimately to the Main Inground Oil/ Water Separator.

Between 1993 and March 2000, the Main Inground Oil/Water Separator was used only for temporary storage of storm water in excess of capacity of the existing water treatment system prior to completion of treatment system upgrades in March 2000. The Main Inground Oil/Water Separator was not used since the treatment system upgrades were completed; however, it was inspected periodically. Documentation of inspections is provided in the quarterly Site Monitoring Report.

2.2 Previous Investigations of Main Inground Oil/Water Separator

Previous investigations performed within and immediately surrounding the Main Separator included sampling of semi-solids within the Main Inground Oil/ Water Separator, periodic visual inspections of the Main Inground Oil/ Water Separator and investigation of soil, groundwater

quality and presence of separate-phase product in the vicinity of the Main Inground Oil/ Water Separator.

2.2.1 Measurement and Sampling of Semi-Solids within the Separator

During the Site Investigation Completion, one composite sample of the solids present was collected from each of the three northernmost compartments of the Separator in November 2001. The composite samples were comprised of solids collected from one to three locations within each compartment. The samples were collected using an excavator to scrape semi-solids from the bottom of the separator at each location. The material was then composited to form a single sample for each compartment. Each composite sample was analyzed for the following for waste characterization purposes:

- Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs) according to USEPA methods SW-846 8021 and 8270 for NYSDEC STARS list compounds, respectively;
- TPH- gasoline range hydrocarbons (GRO) and TPH- diesel range hydrocarbons (DRO) (broken into two ranges, C10 to C18 and above C18) by method SW-846 8015B;
- Reduced target analyte list (TAL) metals by method SW-846 6010 (includes cadmium, chromium, lead, nickel, selenium, thallium and vanadium) and method SW-846 7470/7471 for mercury;
- The full suite of toxicity characteristics leaching procedure (TCLP) analyses;
- Corrosivity;
- Reactivity; and
- Ignitability.

The analytical results of the three composite samples collected from Compartments 1, 2 and 3 of the Main Inground Oil/Water Separator (designated MAINOWS-1, MAINOWS-2 and MAINOWS-3, respectively) are summarized on Table 1. The results indicate the presence of petroleum related VOCs, SVOCs, and metals at elevated concentrations in all three compartments. The concentrations of VOCs and SVOCs were generally higher in Compartment 3 than in the other two.

The analytical results from the TCLP analyses were compared to the USEPA regulatory levels presented in Title 40 of the Code of Federal Regulations (CFR), Part 261.24-Toxicity Characteristic, dated August 31, 1993 (USEPA 1993). The only compound that exceeded the USEPA regulatory level was benzene in the sample from the Compartment 3 (MAINOWS-3) at a concentration of 0.67 milligram per liter (mg/L). The USEPA regulatory level for benzene is 0.5 mg/L. Based upon the waste characterization analyses performed, none of the samples exhibited the characteristics of corrosivity, ignitability sulfide reactivity or cyanide reactivity. Based on the sampling results, the material removed from the Separator was handled and disposed of as a hazardous waste.

In general, solids were encountered in the three northernmost compartments of the former Main Inground Oil/Water Separator. The thickest accumulation (several inches) was observed in the western portion of the northernmost compartment (Compartment 1) in the vicinity of the former pumps. A conservative thickness of three to six inches of semi-solids was found across all three compartments. Evidence of debris (i.e., concrete, pipe and steel) was also found in each compartment.

2.2.2 Periodic Visual Inspections of the Separator

The Main Inground Oil/Water Separator has not been used since the treatment system upgrades were completed in March 2000, however was inspected periodically as part of the on-going operation and maintenance program for the Site until its closure. The three northernmost compartments of the Main Inground Oil/Water Separator had been filled with water prior to its closure. Inspections of the chambers indicate that product sheen had been observed on the water.

2.2.3 Soil Quality in the Vicinity of the Separator

A Geoprobe™ soil and groundwater sampling program was performed to expand upon the data collected during previous investigations by delineating the nature and extent of petroleum-related impacts and identifying the presence of separate-phase product. Soil borings and groundwater sampling from all locations were completed between August 2001 and January 2002. Six soil borings were completed in the vicinity and within the Main Inground Oil/Water Separator. Within three of the abandoned compartments (Compartments 4, 6 and 8, from north to south) of the Main Inground Oil/Water Separator, borings were completed to the bottom of the structure,

which was encountered approximately 14.5 to 15 feet below land surface (bls), based on refusal. Two borings were completed to the north of the Separator and one was completed to the southwest of the Separator. In addition, two soil samples were retained for laboratory analysis from the pilot borings for MW-29 and MW-30.

At all locations, one sample was retained from the shallow interval (top of sample between zero and 2.0 feet bls) and one or more samples in the deeper interval (below 2 feet bls).

Soil samples retained for laboratory analysis from selected intervals were analyzed for the following:

- VOCs and SVOCs according to USEPA methods SW-846 8021 and 8270 for NYSDEC STARS list compounds, respectively;
- Reduced TAL metals by method SW-846 6010 (includes cadmium, chromium, lead, nickel, selenium, thallium and vanadium) and method SW-846 7470/7471 for mercury; and
- TPH-GRO and TPH-DRO (broken down into two ranges, C10 to C18 and above C18) by method SW-846 8015B.

The results indicate that several VOCs, SVOCs and metals exceeded NYSDEC Recommended Soil Cleanup Objectives (RSCOs) contained in the following documents:

- "Division of Hazardous Waste Remediation. Division Technical and Administrative Guidance Memorandum (TAGM) 4046: Determination of Soil Cleanup Objectives and Cleanup Levels" (NYSDEC 1994); and
- NYSDEC revised soil cleanup criteria tables for TAGM 4046 for gasoline and fuel oil contaminated soil dated August 22, 2001 (NYSDEC 2001).

2.2.4 Groundwater Quality in the Vicinity of the Separator

Groundwater samples were collected from SB-12 (south of the Main Inground Oil/Water Separator) during the SFI Completion and subsequent quarterly sampling rounds throughout 2001 and 2002 and analyzed for VOCs and SVOCs. SB-12 was not sampled in July 2001 and January 2002 because the well did not recharge following purging and the well was buried under snow, respectively.

Several SVOCs were detected in SB-12 at concentrations exceeding NYSDEC Ambient Water Quality Standards and Guidance (AWQSG) values for Class GA groundwater presented in the Division of Water Technical and Operational Guidance Series (1.1.1) "Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations" (NYSDEC, 1998) as amended in April 2000. In addition, during a sampling round conducted in August 1999, benzene was the only VOC detected above the AWQSGs. During the April 2002 sampling round, low concentrations of VOCs were detected below the AWQSGs and during the July and October 2002 sampling rounds, no detection of VOCs or SVOCs were present in the groundwater.

In the vicinity of the former Main Inground Oil/Water Separator, where relatively high concentrations of VOCs and SVOCs were observed in soil, groundwater was not collected during the Site Investigation Completion between October 2001 and December 2002 due to the presence of separate-phase product.

2.2.5 Separate-Phase Product Occurrence in the Vicinity of the Separator

Separate-phase product has consistently been observed in monitoring and recovery wells located in the vicinity of the Main Inground Oil/ Water Separator [MW-4 (replaced later by MW-29), RW-5, MW-5, RW-4, MW-8 (replaced later by MW-30) and MW-7]. The product thickness at MW-7 has not been measured since it is too viscous for the probe to pass through. MW-6 showed the presence of separate-phase product between the time of its installation in 1990 through October 1999 and not again until July 2002. No product was observed during the October 2002 gauging round in MW-6. Product was also observed at SB-12 during two gauging rounds in February and March 2000, but not since that time. At MW-29 and MW-30, product was observed during the quarterly gauging rounds in January and July 2002 but not during the October 2002 gauging round. Separate-phase product was also encountered on the groundwater sample collected from one of the soil borings located to the north of the Separator.

Product recovery is ongoing at RW-4 and RW-5 using dual-phase product recovery systems (since September 1993). In addition, product is also being recovered using passive bailers and manual bailing (since February 2000). Between September 1993 and December 2002, approximately 5,033 gallons of separate-phase product have been recovered from wells in the FRA.

3.0 REMEDIAL PROGRAM

The following sections describe the remediation activities performed for the closure of the Main Inground Oil/Water Separator. Daily field forms recorded by the Clean Harbors Environmental Services, Inc. (CHES) during the closure activities are included in Appendix A. Photos are included in Appendix B.

3.1 Construction Operations

The major tasks involved in the closure of the Separator are identified below.

- Implementation of a site specific health and safety plan;
- Mobilization and demobilization;
- Erosion and sediment control;
- Dewatering, stabilization and excavation of the semi-solids;
- Sealing of pipe openings in the Separator walls and removal of debris;
- Backfill and compaction using certified clean fill material, as well as material generated from the ExxonMobil Pipeline Relocation Project located along the former Erie-Lackawanna Railroad property;
- Off-Site transportation and disposal; and
- Site restoration.

3.1.1 Implementation of a Site Specific Health and Safety Plan

All remediation activities were performed in a manner consistent with 29 CFR 1910 and 1926. Moreover, all remediation activities were performed in accordance with the Contractor's Site Specific Health and Safety Plan. A Safety briefing was performed and an ExxonMobil work permit was issued every morning prior to commence the field activities.

3.1.2 Mobilization/Demobilization

The personnel, equipment, materials and Contractor (CHES) for construction related field activities were mobilized at the start of remediation (October 22, 2002) and demobilized at the end of remediation (November 25, 2002).

3.1.3 Erosion and Sediment Control

Staging area for the contaminated material using hay bales and silt fence were installed on October 22, 2002 during the Site preparation.

3.1.4 Dewatering, Stabilization and Excavation of the Semi-Solids

The work performed within the Separator was divided into three main sections (north, center and south cells) and the perimeter cells. The perimeter cells are comprised of the former influent channel to the east of the north, center and south cells. The north cell was not hydraulically connected to the center and the south cells. The center and south cells were hydraulically connected to each other. Originally, the excavation was planned to take place at the center cell first, as described in the Work Plan; however, by the use of a better excavator (Kobelco 300), the excavation took place first at the south cell, proceeding to the center cell and finally to the north cell. Pumps were used to dewater the Separator cells. Temporary piping conveyed the water from the Separator to the lift station. The volume of water pumped from each cell was not recorded. In addition, separate-phase product was present on the north cell during the closure activities. The product was skimmed from the north cell using a vacuum truck, as described below. Below is a description of the work performed in each cell.

<u>South Cell</u>

- Pumping of water was initiated on October 23, 2002 and finalized on October 31, 2002.
- Stabilization of the semi-solids with lime kiln dust (LKD) started on November 1, 2002 and was finalized on November 5, 2002. Approximately 21 loads (approximately 315 cubic yards) of material were removed. The sides and bottom of the cell were scraped using a flat edge bucket to remove the stabilized material.
- Backfilling with clean fill was initiated on November 2, 2002 and finalized on November 24, 2002.

<u>Center Cell</u>

- Pumping of water was initiated on October 23, 2002 and finalized on November 5, 2002.
- Stabilization of the semi-solids with LKD was performed on November 6 and 7, 2002. Approximately 25 loads (approximately 375 cubic yards) of material were removed. The sides and bottom of the cell were scraped using a flat edge bucket to remove the stabilized material.

- Backfilling with clean fill was initiated on November 7, 2002 and finalized on November 24, 2002.

North Cell

- Pumping of water was initiated on October 23, 2002 and finalized on November 8,2002.
- Separate-phase product was visible on the water periodically throughout the closure activities. A total volume of approximately 13,000 gallons of product and water was skimmed and pumped to a frac-tank using a vacuum truck. The water was subsequently decanted from the bottom of the tank and discharged to the lift station. The product was placed in a 8,000-gallon product recovery storage tank located at the treatment building.
- Stabilization of the semi-solids with LKD was performed inside the cell from November 8 through 10, 2002. Approximately 25 loads (approximately 375 cubic yards) of material were removed. Using a flat edge bucket, the sides and bottom of the cell were scraped to remove the stabilized material.
- Backfilling was initiated on November 12, 2002 and finalized on November 24, 2002.

Perimeter Cells

- Pumping of water was performed on November 4, 5 and 24, 2002. Approximately 9,000 gallons were removed.
- Stabilization of the semi-solids with LKD started on November 7, 2002 and was finalized on November 20, 2002. Approximately 21 loads (approximately 315 cubic yards) of material were removed.
- Backfilling with clean fill was initiated on November 11, 2002 and finalized on November 24, 2002.
- The side walls were scraped clean by hand or by the bucket of the backhoe.

3.1.5 Sealing of Pipe Openings in the Separator walls and Removal of Debris

All pipe openings in the Separator walls were abandoned and sealed. Miscellaneous debris including pumps, steel piping, weirs, I-beams, rails, fence and catwalk were also removed from the Separator.

3.1.6 Backfill

After excavation was completed in each cell of the Separator, it was backfilled up to approximately 2 feet below grade with either of the materials described below.

- NYSDOT approved source #5-3R dirt fill (quarry overburden) from Buffalo Crushed Stone, Inc. The documentation certifying the off-site fill as clean as well as the weight scale tickets are provided in Appendix C.

- Fill from the ExxonMobil pipeline relocation project located at the northwest corner of Bailey Avenue and Seneca Street (see Figure 1 for project location). This fill was analyzed at an off-Site laboratory for VOCs, SVOCs, and TAL metals and compared to the NYSDEC RSCOs and NYSDEC Toxicity Characteristic Leaching Procedure (TCLP) Alternative Guidance Values and Human Health Guidance Value presented in the NYSDEC "Spill Technology and Remediation Series (STARS) Memo #1, Petroleum Contaminated Soil Guidance Policy" (NYSDEC 1992). Table 1 presents the analytical data from these samples compared to the various NYSDEC soil quality criteria. Only those compounds detected above the method detection limit are shown. The use of this fill was approved by NYSDEC following their review of the Work Plan.

- A total of 2,130 tons of certified clean fill was used during the project. The remainder of the backfill (5,310 cubic yards) used to close the Separator was obtained from the pipeline project.

3.1.7 Decontamination

All equipment was decontaminated with a high-pressure water wash prior to leaving the site in order to remove any potentially contaminated soil.

3.1.8 Off-Site Transportation and Disposal

The excavated material from the Separator was loaded in 44 trucks on November 19, 20 and 21, 2002 and transported to the Clean Harbors Canada, Inc. disposal facility in Sarnia, Ontario, Canada. 1,177 tons of hazardous waste was transported by dump trailers and disposed at this facility. The haulers were permitted in accordance with United States Department of Transportation (USDOT), state and local requirements, and possessed a USEPA ID number. All vehicles used for the transportation of wastes were also in conformance with USDOT and USEPA requirements and the requirements of New York and Canadian authorities through which the wastes were transported. All applicable manifesting and placarding transportation requirements were implemented. The hazardous waste manifests are included in Appendix D. Steel construction and demolition debris were disposed at the Lake Erie Recycling Corporation/United Alloys in Buffalo, New York. Approximately 53 tons of steel construction

and demolition debris was generated, transported and disposed to this facility during remediation activities. The certified weight tickets for the construction and demolition debris are summarized in Appendix E.

3.1.9 Site Restoration

Backfilling activities were completed up to approximately 2 feet below grade. An additional 1,000 to 1,500 cubic yards of backfill material and seeding will be placed in the area later in the Spring. All temporary facilities were dismantled and removed from the Site. The equipment leaving the Site was decontaminated. All temporary work zone barriers were removed.

4.0 CONCLUSION

Based on the successful completion of the closure of the Separator, no further remediation is required at the Separator.

Respectfully submitted,

Notes:

U - Not Detected
J - Estimated concentration
µg/kg - Micrograms per kilogram
µg/L - Micrograms per liter
mg/kg - Milligrams per kilogram
mg/L - Milligrams per liter
VOCs - Volatile Organic Compounds
SVOCs - Semivolatile Organic Compounds

DAILY ACTIVITIES SUMMARY

PROJECT	ExxonMobil Fmr Separator Closure - Buffalo Terminal	DATE	11/2/02
REPORTING	Bill CamPoPiano	DAY / SHIFT	SAT. 0600 - 1430
SIGNATURE	Bill Campo	WEATHER	COLD SNOW SHOWERS MID 30'S

*Crew arrived at 6:00 AM

-

Weather upon arrival: Cold Cloudy. High 20's.

-

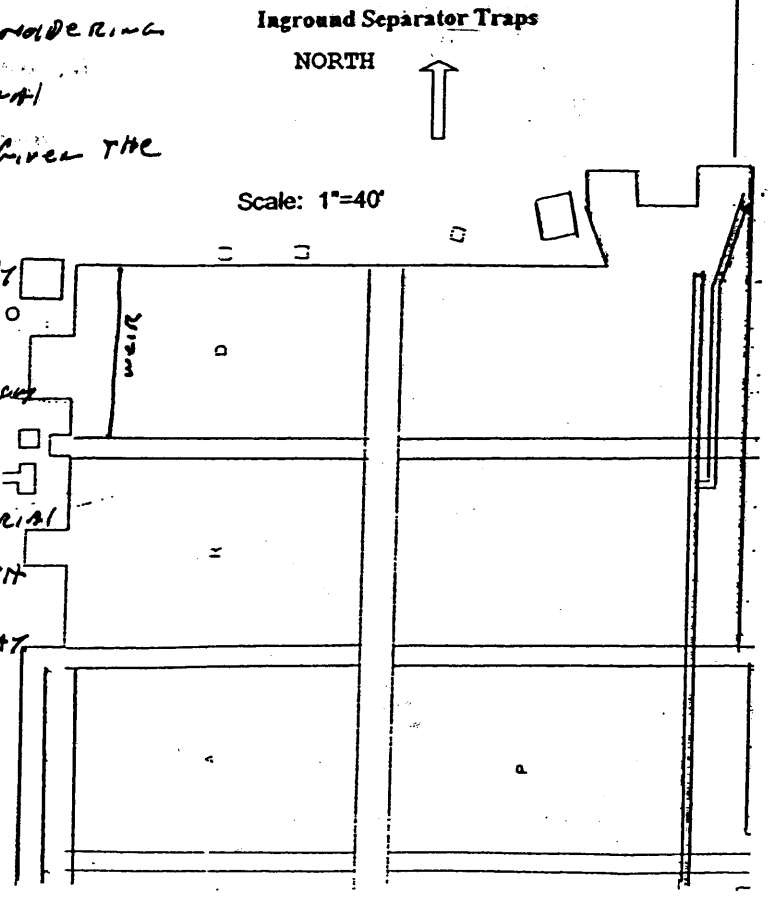

Conducted morning Safety Briefing and sign off. Permit/Tailgate form attached.

-

Equipment and Site Inspection:

Work Activities:

Recd. Exxon Mobil work permit: upon arrival plant operator noticed steel plate (part of weir) on west half of north cell was smoldering aprox. 5"-6" above bottom, water was sprayed on steel and smoldering immediatly stopped. Terminal mgr. notified and 9:00 AM given the ok to cont. working, prior to leaving site weir partially filled w/water. Began cutting & removing steel from former Electric Rack. Stabilized & Removed material from west half of south cell & backfilled half way.

November 13, 2002

Clean Harbors Environmental Services Inc.
32 Bask Road
Glenmont, New York 12077

Re: Mobil/Exxon Job - Elk Street

Dear Billie:

This is to certify that the dirt fill (quarry overburden) supplied to the above referenced project is produced without contaminants. The quarry is a NYSDOT approved source; the Source Number is 5-3R.

Sincerely,

Curt Resetarits
Account Representative

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations and state laws and regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford. I consent to the terms of the attached waiver of consent.
