1 Introduction

On behalf of South Buffalo Development Corporation, LLC (SBD) and PVS Chemical Solutions, Inc (PVS), Inventum Engineering, P.C. (Inventum) has prepared this Excavation Corrective Measures Construction Completion Report (CCR) for the RFI-32AR area on the Buffalo Color Corporation Area E Site (New York State Department of Environmental Conservation [NYSDEC] Site No. C915232).

1.1 Background

Monitoring well RFI-32A was abandoned with NYSDEC approval in Q2 2021. Monitoring well RFI-32AR was installed as close to the former RFI-32A location as possible in July 2022 and quarterly monitoring in accordance with the Site Management Plan (SMP) resumed in August 2022 (Table 1; Figure 1).

Historically, concentrations of contaminants of concern (COCs) in samples from RFI-32A were typically orders of magnitude above the samples from surrounding wells (Table 1). The former RFI-32A and RFI-32AR locations appeared to be in an area outside of the original 2011 remedial excavation (Figure 1). Seven hundred (700) pounds of ORC-A was added to the excavation when the former RFI-32A was abandoned. Groundwater data from samples collected from RFI-32AR since the resumption of sampling in August 2022 were significantly higher than any other detections on the property and notably even higher than the data collected prior to 2022. Specifically, chlorobenzene concentrations in samples from RFI-32AR were an order of magnitude (100,000 to 190,000 micrograms per liter [(ug/L)] higher than the concentrations in the last sample (5,400 ug/L in May 2021) collected from the RFI-32A (Figure 1) and higher than any concentration detected prior to any of the remedial activities completed in 2011.

Chlorobenzene concentrations in confirmation soil samples reported in the 2011 Final Engineering Report (FER) were below the Commercial Use Soil Cleanup Objective (SCO) of 500,000 micrograms per kilogram (ug/kg) (Figure 2; Mactec 2011). Two of the confirmation samples collected in the vicinity of RFI-32AR prior to the FER and Certificate of Completion (CoC) contained concentrations of Chlorobenzene above the Protection of Groundwater Use SCO of 1,100 ug/kg (Figure 2). The confirmation soil sample hydraulically upgradient of RFI-32AR (and the abandoned RFI-32A) contained Chlorobenzene at a concentration of 5,710 ug/kg.

Photoionization detector (PID) readings collected during installation of RFI-32 AR (Appendix A1) contained elevated readings and noted “solvent” like odors generally between 1 and 10 feet below ground surface (bgs) with higher PID readings and stronger odors between 5 and 10 feet bgs. Soil samples were not collected during installation of RFI-32AR; however, waste disposal samples collected from the cuttings were analyzed for Toxicity Characteristic Leaching Procedure (TCLP) Volatile Organic Compounds (VOCs). The TCLP-Chlorobenzene concentration in the TCLP Leachate from the cuttings was 4.5 milligrams per liter (mg/L, Appendix B1).

The routine ongoing groundwater monitoring data, confirmation sample data, and waste disposal data suggested that RFI-32AR was installed in an isolated hot spot of remaining contaminated soil. The soil samples collected during the remedial action were collected at shallower depths than the suspected hot spot. An excavation was proposed to remove, to the extent technically feasible, the remaining soils with concentrations above the Restricted-Residential Use SCO in the vicinity of RFI-32AR. A Corrective Measures Work Plan was submitted to NYSDEC on November 20, 2025 (Inventum 2025) and approved by NYSDEC in a letter dated November 20, 2025.

OSC was responsible for all intrusive site work, backfill, and restoration. 2 Pre-Characterization Test Pit Program

Inventum and OSC completed a pre-characterization test pit program in the proposed excavation area on July 8th and 9th, 2025. Inventum submitted a notice of intrusive activities work plan for the program to NYSDEC on June 27, 2025. Test pits were advanced in order to (1) refine the boundary of the proposed excavation area and (2) collect samples as required to supplement an existing soil waste disposal profile.

All pre-characterization work was conducted in accordance with the BCP Site Excavation Work Plan (EWP), SMP, Health and Safety Plan (HASP), and Community Air Monitoring Plan (CAMP).

2.1 Test Pits

Four (4) test pits were advanced at the locations shown in Figure 2. The upper two feet of cover material from each test pit location was stockpiled adjacent to the excavation area for re-use as backfill. Soils beneath the cover system were screened with a PID and visually assessed as they were excavated and separately stockpiled from the cover soils. Soil samples collected for field screening were collected and placed in a Ziploc bag for a period of 5 minutes before screening. Test pit logs are provided for reference in Appendix C.

2.2 Sample Results

Laboratory samples were collected from each test pit (Table 2). A composite sample was collected from TP-1 for a full waste disposal profile as well as a grab sample for Target Compound List (TCL) VOCs [EPA Method 8260] and TCL Semi-Volatile Organic Compounds (SVOCs) [EPA Method 8270] from the soils exhibiting the highest PID reading. Samples were also collected from the soils exhibiting the highest PID readings at TP-2, TP-3, and TP-4 and analyzed for TCL VOCs and TCL SVOCs. All samples were analyzed by Pace Analytical of Buffalo, NY. Laboratory data reports are provided for reference in Appendix D. CAMP data collected during implementation of the test pit program is provided for reference in Appendix E1. There were no CAMP exceedances during any activity of the corrective measures.

A summary of maximum PID readings and corresponding chlorobenzene concentration is provided in the table below:

Table 2-1: Pre-Characterization Results Summary

Test Pit Location	Maximum PID Readings		Chlorobenzene Concentration (mg/kg)
	Depth (ft. bgs)	PID (ppm)	
TP-1	6	15,000	1,800
TP-2	5	108	250
TP-3	6	270.3	13
TP-4	5	48.9	0.053

2.3 Initial Excavation Extents

The proposed initial excavation areas (Area-1 and Area-2) based on the pre-characterization field screening and laboratory data are shown on Figure 3. Area-1 encompassed approximately 408 square feet (sq. ft) in the vicinity of RFI-32AR, TP-1, and TP-2. The chlorobenzene concentration (1,800 mg/kg) in the immediate vicinity of RFI-32AR was more than an order of magnitude above both the Restricted-Residential Use SCO (100 mg/kg) and of the concentration in the sample of soils to the east from TP-2 (250 mg/kg). Field screening from TP-1 indicated that the soils between 3 and 10-feet bgs were likely contributing to the elevated groundwater exceedances at RFI-32AR with the primary source in soils between 5 and 7 feet bgs (PID between 11,000 to 15,000 ppm). The excavation in the immediate vicinity of RFI-32AR was planned to target excavation and offsite disposal of soils from between 3 and 10-feet bgs. Field screening and laboratory data from TP-2 and TP-3 suggested the area of chlorobenzene impact did not extend as deep as near the former monitoring well. The excavation in this area was planned to target excavation and offsite disposal of soils between 2 and 6-feet bgs. The excavation boundary to the north was defined by soils from TP-4b which had a maximum PID reading of 48.9 ppm in soils from 5-feet bgs and a corresponding chlorobenzene concentration of 0.053 mg/kg. The Area-1 excavation boundary to the east was defined by the western limit of TP-3 which had a chlorobenzene concentration (13 mg/kg) below the Restricted-Residential Use SCO.

The proposed initial excavation also extended to the west (Area-2) and was initially bounded in that direction by the 2011 excavation limits. Additional test pits were proposed to be advanced to the west of RFI-32AR to refine the excavation limits once a batting cage structure was removed to allow access for the excavation.

3 Corrective Measures Excavation

Inventum and OSC completed the corrective measures excavation between December 15, 2025, and January 7, 2026. Inventum submitted a notice of intrusive activities for the excavation to NYSDEC on November 21, 2025. The excavation was conducted in accordance with the BCP Site EWP, SMP, HASP, and CAMP. CAMP data collected during implementation of the excavation is provided for reference in Appendix E2. There were no CAMP exceedances. Daily field logs are provided in Appendix F and include photographs of the excavation and backfill.

3.1 Access and Utilities

The private underground electric and fiberoptic lines that were in the proposed initial excavation limits were deenergized and removed to allow access and safe working conditions. PVS agreed to allow SBD access to the work area utilizing the area to the south containing the railroad spur. Several of the large fence panels were removed to allow access. Construction mats were placed over the rail spur during the excavation activities to prevent any damage to the tracks. The panels were reinstalled following completion of the work.

3.2 Excavation

The excavation was completed in five (5) stages (excavation and backfill), the spatial limits of which are shown on Figure 4. The staged excavation sequencing allowed for the elimination of the need for shoring and allowed excavated soils to be directly loaded to trucks for offsite disposal. Groundwater was not encountered to an extent that required any significant dewatering. In total, six (6) 275-gallon poly totes of excavation water were generated during the excavation and were transported to the Buffalo Color Corporation Site Area A Site (BCP Site No. C915230) and processed through the groundwater treatment system. Excavated soils were not stockpiled. All soils within the spatial and vertical limits shown on Figures 4 through 7 were loaded directly in over-the-road trucks and disposed of offsite.

Soils were routinely screened with a PID throughout the excavation and are documented in the daily field logs (Appendix F) and on the cross-sections shown on Figures 5 through 7. PID readings below 100 ppm as measured in a Ziploc bag were used as the threshold for determining the final horizontal and vertical excavation limits along with a visual and olfactory assessment of the excavated soils. Soils were excavated to total depths between 14 and 17 feet bgs across the excavation with the deepest excavation in the area that contained RFI-32AR (Area 01).

A clay pipe was encountered at a depth of approximately 6-feet bgs in the northern portion of excavation Area 4 (Figure 4). The pipe was 4-inches in diameter, brittle, and appeared to be oriented in a northeast to southwest orientation. The interior of the pipe was stained black and had very strong odors. PID readings from soils underneath the pipe were 800 ppm along the northern wall and 770 ppm along the western wall. Given the location and field screening assessment, the clay pipe was likely a source of the elevated chlorobenzene concentrations at RFI-32AR. There did not appear to be any residual non-aqueous phase liquid in the pipe. NYSDEC was notified of the pipe in a conference call and e-mail on December 23, 2025. The location of the pipe was surveyed and the pipe plugged prior to backfilling excavation Area 4. Samples were collected from beneath the pipe where they were plugged on both the northeastern and southwestern extents prior to backfilling excavation Area 4 and analyzed for TCL VOCs (EPA Method 826) and TCL SVOCs (EPA Method 8270). A summary of those results are provided in Table 3. Chlorobenzene was detected at a concentration (110 mg/kg) slightly above the Restricted-Residential Use SCO of 100 mg/kg in the sample beneath the southwestern limit of the pipe. 1,4-dichlorobenzene was

also detected at a concentration (34 mg/kg) above the Restricted-Residential Use SCO of 24 mg/kg. These soils were excavated and disposed of offsite as part of the excavation of Area 5.

Inventum/OSC continued the excavation and "chased" the pipe to the southwest towards the BCP Site southern downgradient boundary on January 5, 2026. The pipe ended approximately 4 to 5 feet into excavation Area 5. The northeastern limit of the pipe was surveyed, and the pipe was plugged at the location shown on Figures 4 through 7.

3.3 Documentation Sampling

Documentation samples of the excavation base and sidewalls were collected in accordance with DER-10 once the final excavation limits had been achieved based on the field screening. All documentation samples were analyzed for TCL VOCs (EPA Method 8260) and TCL SVOCs (EPA Method 8270). Documentation samples were biased towards locations and depths where field screening indicated the highest potential contamination. Documentation samples results are summarized in Table 4. Documentation sample laboratory data reports are provided in Appendix G1.

There were no detections in the documentation samples above the Restricted-Residential Use SCOs with the one exception noted below:

- Sample Area03-EW-12162025 collected from the east sidewall of excavation Area 3 contained chlorobenzene at a concentration (170 mg/kg) above the Restricted-Residential Use SCO of 100 mg/kg. PID readings were below 100 ppm and there was no odor or visual indication of volatile impact. The concentration of chlorobenzene was below the Commercial Use SCO of 500 mg/kg. Inventum notes that samples collected from this area during the pre-characterization test pit program (13 mg/kg; Table 2 and Figure 2) were well below the Restricted-Residential Use SCOs.

Documentation sample results were uploaded to the NYSDEC EQuIS database on April 15, 2026. Documentation sample Data Usability Summary Reports (DUSRs) are provided in Appendix G2. There were no qualifications that would affect the usability of the data collected. Low-level VOC analysis (EPA Method 8260) was conducted by the laboratory in order to achieve the lowest reporting limits. Samples were unable to be collected using the low-level specifications (EPA Method 5035) due to the nature of the excavation and were instead collected in 4-oz glass jars. As noted in the laboratory reports, reported concentration below 200 ug/kg may be biased low. Inventum notes that this threshold (200 ug/kg) is three orders of magnitude below the Restricted-Residential Use SCO of 100 mg/kg (100,000 ug/kg).

3.4 Waste Disposal

All excavated soils were direct loaded into trucks and disposed of offsite under an approved non-hazardous waste profile at Modern Landfill in Model City, NY. Non-hazardous waste manifests are provided for reference in Appendix H.

A total of 712.9 tons of soil was disposed of offsite (Table 5).

Purge water from the development and sampling of MW-BCP-01 and MW-BCP-02 (approximately 25 gallons) and six (6) 275-gallon totes of excavation water were processed through the Buffalo Color Corporation Site Area A (BCP Site No. C915230) groundwater treatment system.

Two (2) 55-gallon drums of non-hazardous waste were generated from soil cuttings from the installation of MW-BCP-01 and MW-BCP-02. These drums were moved to Area A for temporary storage. Disposal is pending and documentation provided in the next PRR.

3.5 Backfill and Cover

The excavation was backfilled with clay soils imported from the Gernatt Springville plant located in Springville, New York (Appendix I). Excavation areas were backfilled immediately to mitigate the risk of sidewall failure. The upper 2 feet of backfill (0 to 2 feet bgs) consists of imported clay and approximately 6 inches of topsoil. Topsoil was imported from the Gernatt Chaffee Plant located in Chaffee, New York (Appendix I).

A total of 631.46 tons of clay and 66.70 tons of topsoil were imported to the site for use as backfill (Table 6). Clay and topsoil import tickets are provided for reference in Appendix J.

A demarcation fabric was placed over the excavation area at a depth of 2 feet bgs. Inventum notes however, that with the exception of one Nickel detection in the composite sample of the imported clay material (Appendix I), the imported clay and topsoil meet the Unrestricted Use SCOs. The thickness of the cover in the excavated area is equal to the depth of the excavation, i.e. 14 to 17 feet bgs.

3.6 Survey

The spatial and vertical limits of the excavation area as well as the horizontal and vertical location of all documentation sample locations were field surveyed by OSC with a survey grade Global Positioning System (Topcon FC-5000).

Documentation sample locations were uploaded to the NYSDEC EQuIS database on April 15, 2026.

3.7 Deviations from Corrective Measures Work Plan

Cover soils above the existing demarcation fabric were initially planned to be stripped and stockpiled adjacent to the excavation area and then reused as cover soils following the excavation. Instead, these soils were excavated and disposed of offsite and the upper 2 feet of cover (0 to 2 feet) restored with newly imported clay and topsoil.

4 Groundwater Monitoring Well Installation

4.1 Monitoring Well Installation

Monitoring well RFI-32AR was decommissioned during the excavation by removing the entire well and surface completion with an excavator. The decommissioning log is provided for reference in Appendix A2.

Two (2) new monitoring wells were installed on February 2, 2026, within excavation limits. MW-BCP-01 was installed approximately 5 feet south (downgradient) of the former RFI-32AR location and MW-BCP-02 was installed downgradient of the southwestern end of the clay pipe (Figure 4, Figure 9).

Borings were advanced through the excavation backfill using 4.25-inch diameter hollow-stem augers to approximately 16-feet bgs to monitor shallow groundwater. The monitoring wells were constructed with 6-feet of 2-inch diameter polyvinyl chloride (PVC) casing and 10-feet of 2-inch PVC 0.010-inch slotted screen. A filter sand was installed from the bottom of the screened interval to a 1 foot above the top of the screen. A 3-foot bentonite seal was placed on top of the filter pack and allowed to hydrate and cure before completing the remaining annular space with a bentonite-cement grout. Both new monitoring wells were completed with flush-mounted traffic rated steel protective covers. Monitoring well construction logs are provided for reference in Appendix K. The new monitoring wells were developed by removing a minimum of three well volumes. Development was initiated on February 17, 2026, two weeks before sampling occurred on March 4, 2026. MW-BCP-01 was not able to initially be developed due to an ice block in the upper casing. Development was completed on March 27, 2026. MW-BCP-02 was developed two weeks prior to sampling, but went dry, so the well was purged again on March 27, 2026. Monitoring well development logs are provided for reference in Appendix L.

A survey was conducted of the new monitoring wells. The survey was conducted by a surveyor licensed in the State of New York consistent with standard technical practice. All horizontal locations were referenced to the North American datum of 1983 and the New York State Plane system. Vertical elevations were referenced to the North American Vertical datum of 1988 and reported in feet above mean sea level (ft. AMSL). A copy of the monitoring survey is provided in Appendix M.

4.2 Monitoring Well Sampling

The two new monitoring wells were sampled on March 4, 2026, along with the existing three monitoring wells in the quarterly SMP groundwater monitoring program (RFI-29, RFI-33, and MW-E05). Groundwater samples were analyzed for TCL VOCs (EPA Method 8260), TCL SVOCs (EPA Method 8270), and TAL Metals including Mercury (EPA Method 6010).

The results of the groundwater sampling for TCL VOCs and TCL SVOCs are presented in Table 1 and Figure 9. Laboratory data reports are provided for reference as Appendix N.

Chlorobenzene concentrations in the new monitoring wells are four (4) orders of magnitude below the concentrations at RFI-32AR prior to the excavation (Table 1). The concentrations are above the Class GA standard of 5 ug/L but are consistent with groundwater concentrations in the other monitoring wells on the BCP Site (RFI-29 and MW-E05) downgradient of areas where chlorobenzene remains in the soil below the cover system at concentrations below Restricted-Residential or Commercial Use SCOs.

The two new monitoring wells will be incorporated into the quarterly SMP groundwater monitoring program going forward.

5 Conclusions

The corrective measures excavation was completed to remove the hot spot identified at RFI-32AR where chlorobenzene was present in groundwater at concentrations several orders of magnitude above the Class GA standard (5 ug/L) and other monitoring wells in the sampling program.

Documentation sampling of the excavation bottom and sidewalls completed in accordance with DER-10 show the objectives of the excavation program were achieved. Chlorobenzene concentrations in remaining soils along the excavation bottom and sidewalls were all below the Restricted-Residential Use SCO with the exception of one sample from the eastern wall of the excavation (Table 4, Figure 6). Chlorobenzene was detected in the sample from the eastern sidewall at a concentration of 170 mg/kg just above the Restricted-Residential Use SCO of 100 mg/kg. The chlorobenzene concentration in the sample from the test pit (TP-3) completed in this area as part of the pre-characterization test pit program was 13 mg/kg and well below the Restricted-Residential Use SCO (Figure 2). Both samples were collected from soils exhibiting the highest PID readings and/or containing olfactory evidence of volatile contamination and together show the Restricted-Residential SCO objective has been achieved with an average concentration of 91.5 mg/kg.

The two data points along the eastern boundary of the excavation are also reflective of the expected variability given the closeness of the 2011 remedial excavation area where soils below the cover system were allowed to remain in place at concentrations above the Restricted-Residential SCO (Mactec 2011). Documentation sample results from the 2011 remedial excavation show that chlorobenzene is still present within 5 to 10 feet at a concentration double (340 mg/kg at DDE-E06; Figure 2) the documentation sample results (170 mg/kg at Area-03EW; Figure 6) from the corrective measures excavation program.

The clay pipe that was encountered and removed during the excavation was identified as the likely source of the hot spot identified at RFI-32AR based on the (1) location of the pipe relative to the former monitoring well, (2) field screening of soils beneath and around the pipe, and (3) samples collected from soils beneath the pipe (Table 3). The end of the pipe was located to the southwest and confirmed that it does not extend further toward the downgradient BCP Site boundary.

The end of the pipe was located to the northeast, surveyed, and plugged/capped at the excavation boundary (Figure 6). Documentation sample results from areas downgradient of the pipe show that the excavation has removed all soils that may have been impacted. Initial groundwater sample results (Table 1; Figure 9) from the new monitoring wells downgradient of the pipe also show an over 99 percent decrease in chlorobenzene when comparing the last sample from RFI-32AR in December 2025 (110,000 ug/L) and the initial sample from MW-BCP-01 (17 ug/L). These monitoring wells have been added to the routine SMP quarterly monitoring program. Inventum believes the documentation sample results and initial groundwater data show it is not necessary to chase the clay pipe further to the northeast into the 2011 remedial excavation area.

** - Results compared to NYDEC Class GA water quality standards

J - Result is estimated; B - analyte detected in method blank and sample; F1 - MS and/or MSD recovery exceeded control limits.

VOC and SVOC results are shown in ug/L

Results from a field duplicate are shown in row beneath primary sample result.

Blue cells indicate groundwater monitoring events completed prior to the applicaion of ORC-A.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

Results contained within this report relate only to the samples submitted under this Pace Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments and solids are reported on a dry weight basis unless otherwise noted. Tissues are reported "as received" or on a wet weight basis, unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Pace's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Pace Project Manager and made arrangements for Pace to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L2542776-02 through -05: Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

Work Completed:

Day one of soil excavation for southern boundary of Area E near former RFI-32AR. Excavations will be broken up into 5 smaller areas. Air monitoring set up, upwind and downwind for VOCs (PID) and particulate (DustTrack). Tri-axle dump trucks will be live loaded and take excavated soils to Modern Landfill in Model City, NY under waste profile M25-4018. First trucks arrive at 0730, begin soil excavation. All loads will be manifested and signed by Peter Zaffram of Inventum Engineering as the authorized representative of South Buffalo Development, LLC (SBD LLC.).

- Calibrate PID.
- Screen soils with PID and note any signs of impacts.
- Decommission and remove existing monitoring well RFI-32AR with excavator.
- Top 2-feet of soil consist of topsoil.
- Demarcation fabric observed at approximately 2-feet bgs.
- Soil from approximately 2 to 10-feet bgs consist of sandy clay with stone, with trace signs of fill material like brick, concrete, and wood. Soil is stained gray to black. Medium to strong odors are observed.
- PID readings: 8-feet - 64.1 ppm, 10-feet - 88.3 ppm
- Soil from approximately 10 to 16-feet consist of gray clay, sandy, moist with strong odors and slight sheen.
-PID readings: 12-feet - 111.4 ppm, 15-feet - 123.7 ppm.
- Soil from approximately 17-feet consist of medium dense gray clay, with no odors or signs of impacts.
- PID readings: 17-feet 8.4 ppm.
- Samples collected from bottom (17-feet) and south wall of excavation (15-feet).
-Sample ID: AREA01-BOTTOM-12152025 and AREA01-SW-12152025. Bottom sample is 8.4 ppm and south wall sample is 9.4 ppm.
- Backfill Area 01 and move to Area 02.
- Soil from Area 02 are similar to Area 01.
- PID readings: 8-feet - 28.2 ppm, 10-feet - 37.0 ppm, 12-feet - 121 ppm, 15-feet - 263 ppm, and 17-feet 2.6 ppm.
- Sample taken on North wall of Area 02. Sample ID: AREA02-NW-12152025. Sample collected from approximately 10-feet bgs, PID reading 31.4 ppm.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Pace Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Volatile Organics

L2580856-01, -02, -03, -04, -05, -06, -07, -08, -09, -10, -11, and -12: Any reported concentrations that are below 200 ug/kg may be biased low due to the sample not being collected according to 5035-L/5035A-L low-level specifications.

L2580856-05 and -07: The sample was analyzed as a Methanol based upon screen results. The sample was then analyzed as a Straight Soil in order to achieve lower reporting limits. The results of both analyses are reported. Differences were noted between the results of the analyses which have been attributed to sample non-homogeneity.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where

Report Format: DU Report with 'J' Qualifiers

Data Qualifiers

the identification is based on a mass spectral library search.

For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.
