1.0 INTRODUCTION

1.1 Purpose

LaBella Associates, D.P.C. (LaBella) was retained by SpotOn Legacy, LLP to conduct a Remedial Investigation (RI) program at the property located at 145 Ganson Street in the City of Buffalo, Erie County, New York, hereinafter referred to as the "Site" (see Figure 1). The scope of the RI program was consistent with the New York State Department of Environmental Conservation (NYSDEC) approved Remedial Investigation Work Plan (RIWP) dated June 2020, LaBella's subsequent correspondence with the NYSDEC on August 15, 2022, the Aboveground Storage Tank (AST) Closure and Geophysical Survey Letter Work Plan dated June 13, 2024, and was completed in general accordance with NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation. A copy of the August 15, 2022 correspondence is included in Appendix 1. The purpose of the RI program summarized herein was to characterize the nature and extent of contamination occurring at the Site.

LaBella prepared this report on behalf of SpotOn Legacy, LLP to provide a detailed description of the RI program implemented at the Site. In addition to summarizing and documenting the methods used to investigate the Site, this RI Report describes the physical characteristics of the Site; defines the nature, magnitude, and extent of contamination encountered; and assesses the contamination with respect to fate, transport, and exposure.

1.2 Site Background

1.2.1 Site Location & Description

The Site is approximately seven acres and comprised of three tax parcels (127 Buffalo River SBL 122.13-4-2, 189 Ganson Street SBL 122.13-4-1.11 and 191 Ganson Street SBL 122.09-2-4) located within a commercial and industrial area along the Buffalo River. A concrete retaining wall follows the east Site boundary along the Buffalo River. The attached Figure 1 and Figure 2 illustrate the location and boundaries of the Site. Operations at the time of the RI included truck maintenance, a truck washing station, office space and storage for truck parts, drums and vehicles. However, as of the fall of 2024 the Site is currently unoccupied. Additional detail regarding Site operations and Site conditions observed at the Site in May 2024 are detailed within Section 6.1. Although Site redevelopment plans have not been finalized, it is anticipated that initial Site redevelopment will include a commercial mixed-use entertainment facility. There is the potential that multi-family residential may be pursued at the Site in the future. Site Concept Plans are included within Appendix 10.

1.2.2 Site History

The Site has a long history of commercial and industrial operations including machine shops, tin shops, iron ore yards, railroads, a storage and repair shop for a disposal company, trucking companies with repair/washing facilities, and construction companies since at least 1889. Municipal records and regulatory records indicate installation of at least fourteen petroleum underground storage tanks (USTs) at the Site between 1949 and 1980 and removal of at least eight USTs between 1986 and 1988. The exact locations of several USTs were not identified in the historical records obtained. In addition, the number of USTs installed versus the number of USTs removed does not correspond. Additionally, boat docks/slips located on-Site were previously backfilled and brought to grade with fill materials of unknown origin. A comprehensive history of the Site and the locations of environmental concerns are detailed in the previous environmental investigations/assessment included within Appendix 2 and summarized in Section 1.2.3 below.

1.2.3 Previous Environmental Investigations

Investigations

Phase II Environmental Site Assessment (ESA) by AFI Environmental, December 1994

A Phase II ESA was completed by AFI Environmental (AFI) for Waste Management of New York dated December 28, 1994. This study is addressed for 191 Ganson Street; however, it appears to primarily assess the 189 Ganson Street parcel. During the ESA, the property being evaluated was identified as 4.78-acres with one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas.

A previous Phase I ESA, conducted by AFI in 1993, was referenced within the Phase II ESA report (the Phase I ESA was not included in the Phase II report). The Phase I report identified the following recognized environmental conditions (RECs).

- Numerous petroleum-stained areas were observed in both the garage areas and staging/parking areas.
- Confirmatory sampling of the soils in and around former USTs was never conducted.
- Fill materials utilized to fill dry docks north of the Site were shown to contain elevated volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and metals. Groundwater in the area of the Site has also been shown to contain elevated acetone, methylene chloride, and metals.
- Potential impacts on-Site from the Buffalo River.
- Potential discharges of automotive related chemicals into the combined municipal sewer system.
- Historical uses of the property for industrial purposes.
- Potential impacts to soils and stormwater proximate to truck staging areas.

To assess the RECs detailed above, AFI installed five monitoring wells, completed ten soil borings, and collected three sediment samples. Monitoring wells were installed to approximately 17 feet below ground surface (ft bgs) with 10-foot screens to allow infiltration of groundwater. Groundwater was reported at depths ranging between 2.88 ft bgs and 8.02 ft bgs. Soil samples were taken from depths ranging from 0.5 ft bgs and 1.0 ft bgs. Additionally, sediment samples were collected from materials at the bottom of the on-Site catch basins. In total, two soil samples (0.5-1.0 ft bgs), one sediment sample, and five groundwater samples were collected for laboratory analysis. Elevated VOCs and semi-volatile organic compounds (SVOCs) were detected in sample locations proximate to the former UST and fueling/waste container areas. One sludge/sediment sample taken from a surface runoff inlet indicated elevated levels of VOCs, particularly acetone (39,000 parts per billion [ppb]) and toluene (62,400 ppb). PCBs were detected at all sample locations and AFI determined the likely cause to be a result of fill materials brought on-Site or on-Site activity of liquid petroleum fractions within the soil matrix allowing PCBs to become mobile. All groundwater sample results were below applicable NYSDEC standards and guidance.

Based on AFI's Phase II ESA, a more extensive soil/sediment investigation was recommended to determine concentrations, distribution, and source of contaminants within the soil matrix. Once the source boundaries were established, AFI recommended implementation of a corrective action plan based on effectiveness, potential impacts to human health and environment, cost, compatibility with the current operations of the Site, and NYSDEC recommendations.

Phase I ESA Report, November 2018

Benchmark Environmental Engineering and Science, PLLC completed a Phase I ESA for 145 Ganson Street, Buffalo, New York prepared for SpotOn Legacy, LLC dated November 2018. The following RECs were identified in Benchmark's report.

- The long history of commercial and industrial operations (i.e., machine shops, tin shops, iron ore yards, railroads, shipbuilding companies, trucking companies with repair, and construction companies) with numerous USTs and various regulatory listings. Additionally, the Site was historically used as a storage yard and repair shop for Downing Container's garbage pickup, roll off, and rental operations.
- Concrete reportedly associated with former USTs/pump island areas were observed by Benchmark during the site visit as well as black staining.
- The oil/water separator is considered a REC as the integrity is unknown. For purposes of the RI, this oil water separator will be identified as "Oil-Water Separator 1". Refer to Section 5.1 and 6.1.1 for additional information regarding Oil-Water Separator 1.
- The unknown pipe identified protruding from the ground in the northeastern corner of Building 1 is considered a REC because the exact nature of the pipe is unknown and could not be verified by the Site contact.
- The numerous 55-gallon drums/barrels located in Building 2 are considered RECs as Benchmark could not verify the contents.
- It is possible that impacted fill material from unknown sources was brought to the property to use as backfill across the Site, including a former boat slip area and former structure areas.

Phase II ESA Report, February 2019

Benchmark completed a Phase II ESA for 145 Ganson Street, Buffalo, New York over the entire planned Brownfield Cleanup Program (BCP) Site and documented the findings in a report dated February 2019. The Phase II consisted of 21 direct-push soil borings designated SB-1 through SB-21. A total of 12 soil/fill samples were selected for laboratory analysis for Target Compound List (TCL) plus Commissioners Policy 51-51 (CP-51) VOCs, CP-51 SVOCs, Resource Conservation and Recovery Act (RCRA) metals, and/or PCBs. Four soil borings were converted into temporary wells designated as SB-1W, SB-8W, SB-13W and SB-20W and sampled using a dedicated, disposable bailer. The six groundwater samples were analyzed for TCL and CP-51 VOCs. Below is a summary of the Phase II ESA results.

- Fill materials mainly consisting of gravel with sand and/or black granular material mixed with cinders, brick, concrete and/or glass was noted across the Site at depths ranging between two and 10 ft bgs.
- Field evidence of petroleum impact including a peak photoionization detector (PID) reading of 72.2 parts per million (ppm), oily product, staining, and petroleum-type odors was observed within soil samples collected from SB-2 in the area of the southern former USTs and pump islands. In addition, a peak PID reading of 35.3 and petroleum-type odors were observed within soil samples collected from soil boring SB-17 located immediately south adjacent to SB-2. The NYSDEC was notified, and Spill No. 1810799 was assigned to the Site; however, Spill No. 1810799 was assigned a "inactive' status on December 13, 2019 due to the applicant entering the BCP. The subsurface impact related to Spill No. 1810799 is evaluated within this RI/AA Report.
- Field evidence of impact including peak PID readings between 13.2 ppm and 45.7 ppm, petroleum-type odors, and observed sheen on the soil boring polyethylene sleeves was identified within soil samples collected from soil borings SB-8, SB-10, and SB-11 in the area of the USTs and pump island located on the north portion of the Site.

- PAHs were identified at concentrations exceeding CP-51 Soil Cleanup Levels (SCLs), Unrestricted Soil Cleanup Objectives (SCOs), Commercial SCOs and/or Industrial SCOs in five soil/fill samples collected across the Site at SB-7, SB-8, SB-13, SB-14 and SB-21. Metals were identified at concentrations exceeding Unrestricted SCOs, Commercial SCOs and/or Industrial SCOs in eight soil/fill samples collected across the Site at SB-7, SB-8, SB-10, SB-13, SB-14, SB-15, SB-20 and SB-21. Commercial SCO and/or Industrial SCO exceedances were identified at SB-7 (arsenic at 22 mg/kg), SB-8 (barium at 500 mg/kg and lead at 1,550 mg/kg), SB-13 (arsenic at 20.9 mg/kg), SB-14 (arsenic at 23.4 mg/kg), SB-15 (mercury at 12.6 mg/kg), SB-20 (arsenic at 20.3 mg/kg and lead at 1,030 mg/kg), and SB-21 (arsenic at 16.6 mg/kg). PCBs were not identified at a concentration above laboratory detection limits in the soil/fill samples collected across the Site. VOCs were either not detected at concentrations above laboratory detection limits or concentrations were below CP-51 SCLs and Unrestricted SCOs. In the case of SB-2 where field evidence of petroleum impact was identified, this suggests weathered petroleum.
- Analytical results indicated the presence of fill materials impacted by PAHs and metals across the Site with concentrations exceeding 6NYCRR Part 375 Unrestricted Use SCOs and Commercial Use SCOs. More specific locations are discussed in section 3.4 of Benchmark's Phase II ESA.
- VOC concentrations in groundwater samples were either not detected above laboratory method detection limits or were at concentrations below NYSDEC Groundwater Quality Standards and Guidance Values.

A copy of the February 2019 Phase II ESA Report is included within Appendix 2. The results and findings of the February 2019 Phase II ESA Report have been integrated into Sections 6.0, 9.0, and 10.0 of this report.

Remedial Action

Remedial Action Plan Soil Investigation, December 1994

A report titled, "Remedial Action Plan Soil Investigation Report, Downing Container, 191 Ganson Street, Buffalo, New York", was completed by AFI, for Waste Management, dated May 8, 1995. The purpose of this work was to further investigate the extent and composition of impacts and identify the cost to mitigate existing soil/sediment contamination at the Site. Supplemental investigation activities, including five additional soil samples from three distinct areas of concern (former UST area, former roll off dumpster staging area, and gas island/storm sewer inlet area) were obtained. Additionally, five composite soil samples from 6 to 18 inches were collected and analyzed for toxicity characteristic leaching procedure (TCLP) VOCs and TCLP SVOCs. Laboratory analytical results showed an exceedance of naphthalene at one location at a concentration exceeding applicable regulatory criteria. AFL recommended excavation activities on-Site.

Remedial Action Plan, Spill No. 9501488, February 1995

A report titled, "Remedial Action Plan, Downing Container, 191 Ganson Street, Buffalo, New York", was completed by AFI, for Waste Management, dated February 1995. The purpose of the work was to further investigate the areal extent and composition of impact constituents to identify the cost to mitigate existing soil/sediment contamination at the Site. The report detailed AFI's plan to complete additional investigation activities in the three areas of concern identified in AFI's Phase I and Phase II ESA including a former UST area, a former roll-off dumpster area, and a gas island/storm sewer inlet area.

Soil Sediment Remediation Report, Spill No. 9501488, September 1995

A report titled, "Soil and Sediment Remediation Report, Downing Container, 191 Ganson Street, Buffalo, New York", was completed by AFI for Waste Management of New York, dated September 28, 1995. This report is related to Spill No. 9501488 assigned to 191 Ganson Street on May 1, 1995. The purpose of the report is to document the petroleum-impacted soil and sediment encountered at the Downing Container Facility. The following work was completed.

- Removal of soil from former UST area (approximately 20' x 20' x 2.5').
- Excavation of soil from a roll off staging area where toluene contaminated soils were reportedly awaiting NYSDEC approval (approximately 25' x 25' x 18").
- Excavation of staining in parking lot areas near pump islands and vehicle parking areas.
- Sediment removal and cleaning of storm drains.
- Backfilling of excavation areas with No. 2 crusher run.
- Post excavation soil sampling.

It appears that soil/sediment samples were analyzed for Polycyclic Aromatic Hydrocarbons, TCLP VOCs, and PCBs. AFI indicated that no groundwater impacts were identified, and post-excavation composite samples were below background levels or lower.

Reclassification of Spill No. 9501488, October 1995

On October 30, 1995, a letter from the NYSDEC to Waste Management indicated that the Department reviewed the analytical results from the post excavation soil samples and they are not recommending further work since the results were "low levels." Spill No. 9501488 was reclassified as "inactive".

Copies of the previous investigations are included in Appendix 2.

2.0 OBJECTIVES AND RATIONAL

For sites entering the BCP at the point of investigation, NYSDEC requires completion of an RI. Below are the primary objectives of this RI:

- Collect additional on-Site media samples, under appropriate quality assurance/quality control criteria, to better delineate the nature and extent of contamination.
- Assess the groundwater flow direction and groundwater quality conditions at the Site.
- Determine if the concentrations of constituents of concern in soil and/or groundwater pose potential unacceptable risks to human health and the environment.
- Provide data needed to evaluate potential remedial measures and determine appropriate actions to address potential significant risks.
- Provide a qualitative exposure assessment.

3.0 STANDARDS, CRITERIA, AND GUIDANCE

The following standards, criteria, and guidance (SCG) utilized as part of the implementation of the RI are identified below:

Soil SCGs: The following SCGs for soil were used to evaluate the Site:

- NYCRR Subpart 375-6 Unrestricted Use SCOs
- NYCRR Subpart 375-6 Restricted Residential Use SCOs
- NYCRR Subpart 375-6 Commercial Use SCOs

Groundwater SCGs: The following SCGs for groundwater were used to evaluate the Site:

- NYSDEC Part 703 Groundwater Standards
- TOGS 1.1.1 Water Quality Standards and Guidance Values and February 2023 addendum
- NYSDEC's Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS) dated April 2023
- New York State Department of Health (NYSDOH) established drinking water standard maximum contaminant level for 1,4-dioxane

Soil Vapor SCGs: The following SCGs for soil vapor were used to evaluate the Site:

- NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in the State of New York" dated October 2006, and Soil Vapor/Indoor Air Matrix Tables Addendums dated May 2017 and February 2024, Table 3.1 (revised September 2013 and August 2015) air guidance values

4.0 SUMMARY OF REMEDIAL INVESTIGATION ACTIVITES

The scope of the RI program was generally consistent with the NYSDEC approved RIWP dated June 2020, LaBella's subsequent correspondence with the NYSDEC on August 15, 2022, the AST Closure and Geophysical Survey Letter Work Plan dated June 13, 2024, and was completed in general accordance with NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation. The RI program encompassed the following major tasks:

- Air monitoring was conducted in accordance with the NYSDOH Generic Community Air Monitoring Plan (CAMP).
- Geophysical Survey to evaluate the Site for the potential presence of orphaned USTs or other subsurface anomalies of potential environmental concern.
- Collection and chemical analysis of on-Site surface soil/fill samples to characterize the chemistry of these materials.
- Completion of test pits and soil borings to enable the classification, screening, sampling, and chemical characterization of subsurface soil/fill.
- Installation, development, and sampling of groundwater monitoring wells to evaluate groundwater flow direction and gradient, and to facilitate the collection and chemical analysis of groundwater samples.
- Collection of soil vapor samples from the Site.
- Closure/removal of one 10,000-gallon diesel AST (NYSDEC PBS No. 9-421227).
- Third party validation of laboratory data and preparation of a Data Usability Summary Report (DUSR).

- Evaluation of the resulting data and preparation of a report to:
    - Summarize and document the activities performed during the RI.
    - Describe the physical characteristics of the Site.
    - Describe the nature, magnitude, and extent of contamination.
    - Compare the analytical data to applicable regulatory levels.
    - Evaluate contaminant fate and transport.
    - Qualitatively assess exposure to Site contaminants under current and future use scenarios.

4.1 Field Investigation

The following subsections describe the scope of field activities implemented during the remedial investigation program.

4.1.1 Surface Soil/Fill Sampling

Three surface soil/fill samples, identified as SS-1 through SS-3, were collected on September 14, 2022 to characterize surface soil/fill within the limited vegetated areas present on the northwestern portion of the Site. The surface soil/fill samples were collected from zero to two inches below the ground surface (bgs). Surface soil/fill samples were collected in pre-cleaned and pre-preserved laboratory sample bottles, placed on ice, and delivered under chain of custody for laboratory analysis. The samples were analyzed for TCL SVOCs plus Tentatively Identified Compounds (TICs) and Target Analyte List (TAL) metals. One location (SS-2) was also analyzed for Full List VOCs (TCL VOC plus CP-51 VOCs) plus TICs, PCBs, herbicides, pesticides, 1,4-dioxane, and PFAS. The remaining exterior areas are generally void of vegetation and soil in the upper two inches; therefore, per the June 2020 RIWP, surface soil samples were not collected from remaining portions of the Site. Table 1A summarizes the conditions observed within the surface soil samples collected and the laboratory analysis performed. Table 2 summarize the surface soil laboratory results and Figure 3 depicts the surface soil sample locations.

4.1.2 Test Pit Excavations

Twenty-four test pits identified as TP-1 through TP-24 were excavated across the Site between September 26 and 28, 2022. The purpose of TP-1 through TP-24 was to generally characterize the subsurface soil conditions at the Site. An additional five test pits identified as TP-25 through TP-29 were advanced at the Site on October 17, 2024 to evaluate the severity and extent of suspect petroleum-related staining identified beneath the location of one 10,000-gallon diesel AST removed on October 8, 2024. Refer to Section 5.2 for additional information related to the removed 10,000-gallon diesel AST. The purpose of TP-29 was to assess the source of a geophysical anomaly (Anomaly 3) identified within the July 1, 2024 Geophysical Engineering Survey Report. Refer to Section 5.1 for additional information related to the Geophysical Engineering Survey Report. The locations of the test pits are depicted on Figure 3.

A track-mounted excavator was utilized to advance the test pit excavations to terminal depths ranging from approximately 7 ft bgs to 15 ft bgs. Apparent groundwater was encountered within test pits TP-1 through TP-24 between approximately 2 and 7 ft bgs. The depth of test pits TP-7, TP-8, and TP-22 were limited to 10, 13, and 7 ft bgs respectively due to significant groundwater infiltration and soughing. Test pit TP-15 was ceased at 11 ft bgs due to collapse of the excavation. Test pit TP-18 was ceased at 10 ft bgs to avoid potential undermining risk considering the test pits location adjacent concrete paved surfaces.

Test pit TP-6 was attempted to be advanced slightly north of the location depicted with the figures attached to this report; however, the initial selected location encountered a layer of asphalt overlaying a what appeared to be a thick concrete slab. As such, TP-6 was shifted south beyond the edge of the apparent

concrete slab. The nature and extent of the concrete slab is unknown; however, such may have been associated with a historic structure building slab/foundation.

Test pit TP-9 encountered an apparent concrete structure consistent with a footer. The suspect footer was located within the east limit of TP-9. The nature and extent of the suspect footer is unknown; however, such may have been associated with a historic structure building slab/foundation.

Test pit TP-29 was advanced to 7 ft bgs at which depth a large concrete structure was encountered. The nature of the concrete structure could not be confirmed; however, the concrete structure appeared consistent with a foundation component. Based on review of historical Sanborn maps and aerial photography, the footprint of a historical pipe/tin shop was located at the Site between at least 1925 and 1963 in a location consistent with Anomaly 3 (refer to Section 5.1). As such, it is likely the concrete structure encountered within TP-29 is a remaining foundation component associated with the historical pipe/tin shop.

Fill material was encountered within all of the test pits advanced from the ground surface to a maximum depth of 6 ft bgs. Fill material encountered within the test pits consisted of sand, gravel, brick, concrete, asphalt/pavement, ash, wood, railroad ties, rebar, and glass. A tire and plastic tarp material was encountered within TP-10. In addition, slag was encountered in test pits TP-11, TP-12, TP-17, TP-18, TP-19, TP-20, and TP-21. Native soil was encountered beneath the fill to the terminal depths of the test pits consisting of silt, and clay, with select test pits encountering intermixed sand and gravel.

Excavated materials were staged immediately adjacent to the test pit on plastic in the order in which it was excavated. Excavated soil/fill from each test pit was continuously assessed for visual and olfactory evidence of impacts (e.g., staining, odor, etc.), and/or detectable levels of Total Organic Vapors (TOVs) using a PID. Positive indications from any of these screening methods are collectively referred to as "evidence of impairment". Soil/fill characterizations and PID readings were recorded on field sheets. Following characterization and sample collection, the excavated soil/fill was returned to the test pit from which it originated. The excavator bucket was decontaminated between each test pit utilizing a power washer and potable water. Field logs detailing the observations made during the test pits activities are included in Appendix 3. Based on the field observations, no field evidence of impact was encountered within the test pits advanced at the Site with the exception of the following.

- TP-1 exhibited a PID reading of 41.9 ppm from 3-6 ft bgs. Suspect petroleum-type odors was observed within soil collected from the ground surface to 3 ft bgs.
- TP-2 exhibited a PID reading of 1.2 ppm from 2-5 ft bgs.
- TP-6 exhibited a PID reading of 1.7 ppm and a slight suspect petroleum-type odor from 0-3 ft bgs.
- TP-25 exhibited a PID a peak PID reading of 87.9 ppm from 2-3 ft bgs. Suspect petroleum-type odors and staining was observed within soil collected from the ground surface to 6 ft bgs.
- TP-26 exhibited a peak PID reading of 5 ppm from 4-5 ft bgs.
- TP-27 exhibited a PID reading of 3.5 ppm from 2-3 ft bgs.
- TP-28 exhibited a PID reading of 3.5 ppm from 2-3 ft bgs.

A total of 29 subsurface soil/fill samples were collected from the test pits, placed in pre-cleaned and pre-preserved laboratory sample bottles, placed on ice, and shipped under chain of custody and submitted for laboratory analysis. The test pit soil samples were generally biased towards soil/fill exhibiting elevated PID readings, field evidence of impact (i.e. suspect poolroom-type odors, suspect petroleum-type staining, etc.), and horizons containing fill material. Generally the soil samples collected from the test pits were analyzed

for Full List VOCs plus TICs, TCL SVOCs plus TICs, PCBs, herbicides, pesticides, 1,4-dioxane, TAL Metals, and PFAS. Table 1A summarizes the subsurface conditions encountered within the test pits and the laboratory analysis performed. Table 3A and 3B summarize the test pit subsurface soil laboratory results and Figure 3 depicts the test pit locations.

4.1.3 Soil Boring and Well Installation

Ten soil borings (SB-22 through SB-31) were advanced across the Site between September 6 and 8, 2022. Soil borings SB-22 and SB-23 and soil borings SB-24 and SB-25 were advanced through the concrete slab within Building 1 and Building 2 respectively to assess the subsurface soil conditions beneath each corresponding building. Soil borings SB-26 through SB-31 were advanced on the exterior of the Site for the primary purpose of facilitating installation of groundwater monitoring wells with a secondary purpose of evaluating subsurface soil conditions. A track-mounted Geoprobe was used to advance the soil borings into the overburden materials using a direct push soil sampling system. The Geoprobe utilizes a 5-foot MacroCore® sampler with disposable polyethylene sleeves. Soil cores are retrieved in 5-foot sections and cut from the polyethylene sleeves for observation and sampling. Soil borings were advanced to a maximum depth of between 6.3 and 16 ft bgs. Equipment refusal was not encountered within any of the soil borings advanced, with the exception of soil boring SB-25 which encountered refusal at 6.3 ft bgs due to the presence of fill material (i.e. apparent wood). Apparent groundwater was encountered in all of the soil borings advanced between approximately 4 and 10 ft bgs.

Fill material consisting of concrete, asphalt, brick, gravel, coal, wood, ash, silt, sand, and clay was encountered within all of the soil borings advanced to a maximum depth of between 1.5 and 10 ft bgs. Slag was encountered in soi boring SB-27 from between approximately the ground surface to 3 ft bgs. Apparent native soil was encountered beneath the fill to the terminal depths of the soil borings consisting of silt, sand, clay, and gravel.

The MacroCore® sampler was decontaminated between boring locations using an Alconox and potable water solution. Continuous samples were collected throughout the depth of each soil boring. Retrieved soil/fill samples from each soil boring location were assessed for visual and olfactory indications of impairment, and/or detectable levels of TOVs using a PID. Soil/fill characterizations and screening values were recorded on Soil Boring Logs included in Appendix 3. Based on the field observations, no field evidence of impact was encountered within the soil borings advanced with the exception of the following.

- SB-25 exhibited a peak PID reading of 55.8 ppm from 5-6.3 ft bgs. Suspect petroleum-type staining was observed within soil collected from 0.4 to 6.3 ft bgs.
- SB-27 exhibited a peak PID reading of 5.5 ppm from 3-3.5 ft bgs.
- Soil collected from SB-31 from 14.5-15 ft bgs exhibited suspect petroleum-type odors; however, this sample interval exhibited a PID reading of 0.5 ppm. No other PID readings above 0.0 ppm were detected within this soil boring.

Five subsurface native soil samples (SB-23, SB-27, SB-28, SB-29, and SB-31) and five subsurface fill samples (SB-22, SB-24, SB-25, SB-26 and SB-30) were collected from the soil borings, placed in pre-cleaned and pre-preserved laboratory sample bottles, placed on ice, and shipped under chain of custody for laboratory analysis for laboratory analysis. Generally the soil samples collected from the soil borings were analyzed for Full List VOCs plus TICs, TCL SVOCs plus TICs, PCBs, herbicides, pesticides, 1,4-dioxane, TAL Metals, and PFAS. Table 1A summarizes the subsurface conditions encountered within the RI soil borings and the laboratory analysis performed. Table 3B summarize the RI subsurface soil laboratory results and Figure 3 depicts the RI soil boring locations.

Exterior soil borings SB-26 through SB-31 were completed with two-inch groundwater monitoring wells MW-3 through MW-8 screened in the uppermost water-bearing zone within the overburden. Each monitoring well was constructed with five feet of 0.010-slot pre-packed well screen connected to an appropriate length of solid PVC well riser to complete the well. The annulus of the soil boring was backfilled with quartz sand to a nominal depth of one to two feet below the ground surface. A bentonite seal was placed above the sand pack and the monitoring well was finished with a flush mount casing. Monitoring well construction logs are included in Appendix 3. Figure 3 depicts the locations of the groundwater monitoring wells.

4.1.4 Groundwater Sampling

The two existing groundwater monitoring wells (MW-1 and MW-2) and the six newly installed groundwater monitoring wells (MW-3 through MW-8) were developed by LaBella personnel between September 9 and September 14, 2022, and subsequently sampled on September 20 and 21, 2022 utilizing low-flow sampling procedures. Prior to the initiation of groundwater sampling, the static groundwater levels in each well were measured using an electronic water interface probe, with the exception of MW-1 which had an obstruction in the well.

During and after the completion of development for each well, water quality indicator parameters (pH, specific conductance, temperature, oxidation reduction potential, and turbidity) were recorded for each well volume purged. Monitoring wells were generally developed via surge and purge methodology using a disposable polyethylene bailer followed by low flow purging to clear out any turbidity (with the exception of MW-1 which had an obstruction in the well). During sampling, low flow methods were used and relative parameter stabilization was achieved. The groundwater samples were collected in pre-cleaned and pre-preserved laboratory sample bottles, placed on ice, and shipped under chain of custody for laboratory analysis. The samples were analyzed for Full List VOCs plus TICs and TCL SVOCs plus TICs. Additionally, MW-4, MW-5, MW-6 and MW-8 were analyzed for Full List VOCs plus TICs, TCL SVOCs plus TICs, PCBs, pesticides, herbicides, TAL metals, 1,4-dioxane, and PFAS. Table 1B summarizes the groundwater laboratory analysis performed. Table 5B summarizes the RI groundwater laboratory results. Well development and sampling logs are included in Appendix 3. The locations of the groundwater monitoring wells are depicted on Figure 3. Groundwater elevation and contours are depicted in Figure 5.

4.1.5 Soil Vapor Sampling

Four soil vapor samples (SV-1 through SV-4) were collected at the Site on September 12, 2022. Soil vapor points were installed in general conformance with the New York State Department of Health (NYSDOH) Soil Vapor Intrusion Guidance. Each soil vapor sample probe was manually installed using specialized, stainless-steel soil probe rods. Sampling equipment included six-inch long sampling screens and ¼-inch inside diameter inert sample tubing. Soil boreholes were advanced to a depth of 5 ft bgs using steel rods equipped with an anchor point at the driving end of the rod. The anchor point was connected to the sampling screen and tubing on the inside of the steel rod. Once the steel rod was advanced to the target depth, the steel rod was retracted, leaving the anchor point, sampling screen, and sampling tubing within the borehole annulus. Glass beads were poured around the sampling screen in a manner to cover the entire length of the screen. Bentonite was then placed over the beads to the ground surface to create a seal prohibiting infiltration of ambient air into the sampling area.

Once the sample probes were installed, the probe and tubing were purged of three volumes using a calibrated syringe as required by NYSDOH guidance. Helium tracer gas was used during the purging phase to ensure that the probes were sealed. Helium tracer gas was not detected during purging. Subsequent purging, samples were collected over an approximate four-hour period using laboratory supplied six-liter SUMMA canisters. Each canister was fitted with a laboratory calibrated flow controller. All soil vapor samples were analyzed for VOCs via USEPA Method TO-15. An outdoor air sample (OA-1) was also collected

concurrently with the four soil vapor samples. The outdoor air sample was collected from ground level at an upwind location.

Table 1B summarizes the soil vapor laboratory analysis performed. Table 6 summarizes the soil vapor analytical results and Figure 3 depicts the soil vapor sample locations. Air sampling logs are included in Appendix 3.

4.2 Sample Analysis/Validation

4.2.1 Laboratory Analysis

Eurofins Environmental Testing America (Eurofins) performed the chemical analyses of all soil/fill, groundwater, and soil vapor samples collected from the Site related to RI activities. Eurofins is accredited under the New York State Environmental Laboratory Approval Program (ELAP) Contract Laboratory Program (CLP). All samples collected during the RI were analyzed using the applicable methods prescribed by the NYSDEC Analytical Services Protocol (ASP), June 2000. Category B deliverables were generated for these samples. Table 1A and 1B summarizes the laboratory analysis performed for each sample collected. Laboratory analytical reports are included in Appendix 4.

4.2.2 Quality Assurance/Quality Control Samples

In addition to field samples, Quality Assurance/Quality Control (QA/QC) samples were collected to evaluate the effectiveness of the QA/QC procedures implemented during the field and laboratory activities associated with the project. As reflected by Table 1A and 1B, QA/QC samples included matrix spike (MS) and matrix spike duplicate (MSD) samples, trip blanks, and blind field duplicates.

4.2.3 Data Validation

Validation of the laboratory data generated from the chemical analysis of soil/fill and groundwater samples in accordance with the *NYSDEC Guidance for the Development of Data Usability Summary Report*s (DUSRs) was performed by Data Validation Services (DVS). The data packages were reviewed for completeness and compliance relative to the criteria specified in the aforementioned NYSDEC document. A detailed comparison of the reported data with the raw data submitted as part of the supporting documentation package and applied protocol-defined procedures for the identification and quantitation of the individual analytes was also conducted to determine the validity of the data. DUSRs were prepared for the data packages and include a narrative summary discussing all quality issues and their impact on the reported results. The DUSRs are presented in Appendix 5. Further discussion of data validation is presented in Section 8.0.

4.3 Deviations from Remedial Investigation Work Plan

The scope of the RI program was generally consistent with the NYSDEC approved RIWP dated June 2020 and LaBella's subsequent correspondence with the NYSDEC on August 15, 2022. Additional tasks described below were also completed in response to the NYSDEC's March 28, 2024 Report Comment Letter. Deviations from the scope are detailed below.

- The RIWP included collection of five soil samples from the soil borings and 12 soil samples from the test pits for laboratory analysis for Full List VOCs plus TICs. However, to further evaluate vertical native and fill horizons, the horizonal conditions at the Site, and locations exhibiting PID or field evidence of impact, seven soil samples were collected from the soil borings and 13 soil samples were collected from the test pits for Full List VOCs plus TICs laboratory analysis.
- Per the Aboveground Storage Tank (AST) Closure and Geophysical Survey Letter Work Plan dated June 13, 2024, one 10,000-gallon diesel AST was removed from the Site and a geophysical survey

was completed. This scope or work also included advancement of five additional test pits (TP-25 through TP-29), and collection of an additional five soil samples for laboratory analysis for Full List VOCs plus TICs, TCL VOCs plus TICs, and TAL metals. Refer to Section 4.1.2 and 5.0 for additional information.

- Per LaBella's correspondence with the NYSDEC on August 15, 2022, the RI scope of work include collection of four soil samples from the soil borings for laboratory analysis for 1,4-dioxane and PFAS. However, to further evaluate vertical native and fill horizons and the horizonal conditions at the Site, five soil samples were collected from the soil borings for 1,4-dioxane and PFAS laboratory analysis.
- Section 3.2.3 of the RIWP states that VOCs plus TICs will be added to the analytical scheme at any location exhibiting elevated PID readings. Soil collected from TP-1 exhibited a PID reading of 41.9 ppm from 3-6 ft bgs. Although soil was collected from TP-1 (2-3 ft bgs) and submitted for laboratory analysis, the laboratory analysis performed excluded VOC plus TICs analysis. Refer to Table 1A for a complete list of the laboratory analysis performed on the soil sample collected from TP-1 (2-3 ft bgs). Refer to Section 9.1.2 for a detailed evaluation related to field observations and the corresponding soil results within the soil/fill samples collected from the Site.
- Monitoring wells were developed with a disposable bailer via surge and purge methodology and then pumped with a peristaltic pump in lieu of exclusively using a disposable bailer. Additionally, MW-1 was developed with a peristaltic pump due to an obstruction in the well.

5.0 SUPPLEMENTAL ACTIVITIES

The scope of the supplemental activities detailed below are consistent with the June 13, 2024 AST Closure and Geophysical Survey Letter Work Plan, and subsequent correspondence with the NYSDEC included in Appendix 1..

- Geophysical Survey of the Site
- Closure of one 10,000-gallon diesel AST

5.1 Geophysical Survey

On June 26, 2024, Nova Geophysical Services (Nova) completed a geophysical survey at the Site for the following purposes.

- Identify current or former substructures, obstacles, pipes, potential USTs, anomalies, and other abnormalities.
- Identify current or former utilities or other embedded conduits.
- Perform pipe tracing to identify unknown pipes.
- Prepare a technical report summarizing field findings including subsurface structures, utilities, anomalies, and other abnormalities.

The results of the Geophysical Survey are contained within the Geophysical Engineering Survey Report dated July 1, 2024 included in Appendix 6. The results of the geophysical survey revealed the following.

- The location of subsurface electric, natural gas, water, and sewer utilities.
- No anomalies consistent with orphaned USTs were identified at the Site.
- The location of an oil-water separator located immediately north adjacent of Building 1. It should be noted that the location of this oil water separator is consistent with the location of the Oil-Water

Separator 1 observed during the November 2018 Phase I ESA (refer to Section 1.2.3) and during LaBella's site visit on May 21, 2024 (refer to Section 6.2). The geophysical survey identified that Oil-Water Separator 1 is connected to floor drains located within Building 1 which discharge through Oil-Water Separator 1 to the municipal sewer system. Floor drains within Building 1 consist of a trench drain located within the central portion of Building 1 previously utilized for truck maintenance and a trench drain and square floor drain located within the east portion of Building 1 previously utilized for truck washing. It should be noted that the November 2018 Phase I ESA reported "no concerns (staining, odors, etc.) proximate the drains". Site observations collected by LaBella during previous site visits to prepare for RI field activities in September 2022 as well as site visits in May 2024 were consistent with the observations reported within the November 2018 Phase I ESA and did not observe evidence of release within the work areas adjacent the floor drains located within Building 1. Soil borings SB-20W and SB-23 advanced adjacent to Oil-Water Separator 1 did not identity field evidence of impact (i.e., odors, staining, elevated PID readings) or contaminants exceeding Part 375 Residential or Commercial Soil Cleanup Objectives with the exception of manganese, arsenic, and lead. In addition, groundwater samples collected from SB-20W located hydraulically downgradient of Oil-Water Separator 1 did not identify any concentrations of VOCs exceeding NYSDEC GA groundwater standards. Considering that there is no subsurface information at the Site to suggest that Oil-Water Separator 1 is a source of subsurface impact, it is LaBella's opinion that the Oil-Water Separator 1 represents a low environmental risk and that removal or closure of the Oil-Water Separator 1 can be completed concurrent with implementation of the final remedy.

- A geophysical anomaly was identified located within the extreme northeast interior of Building 1 beneath the concrete slab, hereinafter referred to as "Suspect Oil-Water Separator 2". Although the dimensions of Suspect Oil-Water Separator 2 have not been confirmed, it appears that Suspect Oil-Water Separator 2 is square in shape, rather small in size, and no more than five feet long and five feet wide. Photos of Suspect Oil-Water Separator 2 are included within the Geophysical Survey Report. The geophysical survey revealed private sewer lines connecting Suspect Oil-Water Separator 2 to the trench drain located immediately west of Suspect Oil-Water Separator 2 and the greater private sewer line discharging through Oil-Water Separator 1 to the municipal sewer system. It should be noted that there are no surface features observable from within Building 1 or within the footprint of the anomaly that would allow for visual access to the Suspect Oil-Water Separator 2. Soil borings SB-20W and SB-23 advanced adjacent to Suspect Oil-Water Separator 2 did not identity field evidence of impact (i.e., odors, staining, elevated PID readings) or contaminants exceeding Part 375 Residential or Commercial Soil Cleanup Objectives with the exception of manganese, arsenic, and lead. In addition, groundwater samples collected from SB-20W located hydraulically downgradient of Suspect Oil-Water Separator 2 did not identify any concentrations of VOCs exceeding NYSDEC GA groundwater standards. Considering that there is no subsurface information at the Site to suggest that Suspect Oil-Water Separator 2 is a source of subsurface impact, it is LaBella's opinion that the Suspect Oil-Water Separator 2 represents a low environmental risk and that removal or closure of the Suspect Oil-Water Separator 2 can be completed concurrent with implementation of the final remedy.
- As observed by LaBella during previous site visits including the May 21 and 30, 2024 site visit, a pipe of unknown nature protrudes from the east exterior wall of Building 1, then travels vertically along the east interior wall of Building 1 and enters the interior concrete floor within the area delineated to contain Suspect Oil-Water Separator 2. Geophysical assessment of the pipe of unknown nature concluded that the pipe of unknown nature appears to be connected to Suspect Oil-Water Separator 2. As such, the pipe of unknown nature does not appear to be of environmental concern at this time.
- A scattered geophysical anomaly consistent with disturbed soil and backfill was identified south of Building 1, hereinafter referred to as "Anomaly 1". The location of Anomaly 1 is consistent with the

known location of historical UST's and a pump island detailed within Figure 2 of the February 2019 Phase II ESA included within Appendix 2. As such, Anomaly 1 is likely related to the presence of backfill or disturbed soil associated with previous UST and pump island closure activity. The subsurface conditions proximate Anomaly 1 have been assessed by investigation locations SB-1, SB-2W, and SB-16 through SB-19.

- A scattered geophysical anomaly consistent with disturbed soil and backfill was identified southeast of Building 2, hereinafter referred to as "Anomaly 2" . The location of Anomaly 2 is consistent with the known location of a historical 10,000-gallon diesel UST detailed within Figure 2 of the February 2019 Phase II ESA included within Appendix 2. As such, Anomaly 2 is likely related to the presence of backfill or disturbed soil associated with previous UST closure activity. The subsurface conditions proximate Anomaly 2 were assessed by investigation locations SB-6 and TP-6.
- A scattered geophysical anomaly consistent with disturbed soil and backfill was identified east of Building 2, hereinafter referred to as "Anomaly 3". The source of Anomaly 3 was evaluated through advancement of test pit TP-29 which encountered a large buried concrete foundation component likely associated with the historical pipe/tin shop.

Photographs and the location of the structures discussed above are included within Geophysical Engineering Survey Report in Appendix 6. Additional photographs collected during LaBella's May 21 and 30, 2024 site visit are included in Appendix 8.

5.2 AST Closure

One 10,000-gallon diesel AST associated with petroleum bulk storage (PBS) Site Number 9-421227 was removed from the Site on October 10, 2024. The results of the AST closure is summarized within the AST Closure Report dated February 18, 2025 included within Appendix 7.

Due to the presence of suspect-petroleum stained soil observed subsequent removal of the AST, LaBella re-mobilized to the Site on October 17, 2024 and advanced test pit excavations TP-25 through TP-28 to evaluate the conditions proximate the former AST location as is detailed within Section 4.1.2 and 8.2.

6.0 PHYSICAL CHARACTERISTICS OF THE SITE

6.1 Setting

The Site is currently improved with Building 1 located on the south portion of the Site and Building 2 located on the north portion of the Site. Exterior portions of the Site primarily consist of asphalt paved or gravel surfaces with limited green space on the north portion of the Site. Refer to Section 6.1.1 below regarding Site conditions recorded in May 2024.

The Buffalo River borders the Site to the east. A concrete retaining wall separates the Buffalo River from the Site, and the location of the concrete retaining wall appears consistent with the Site boundary. Although construction drawings related to the concrete retaining wall along the Buffalo River and southeast Site Boundary are not available, inspection of the concrete retaining wall in May 2024 revealed that the concrete retaining wall was in good condition. No evidence of retaining wall failure or erosion into Buffalo Creek was observed. Refer to Section 6.1.1 below regarding Site conditions recorded in May 2024 and Section 6.3 regarding the hydrogeologic influence of the retaining wall.

The topography of the Site is slightly sloping to the southeast with an elevation of approximately 595 to 600 ft above mean sea level according to the USGS 7.5-minute, Buffalo SE, New York quadrangle map.

According to the United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS) Web Soil Survey (WSS), the Site consists of Urban land. Urban land is described as areas with soils that have been disturbed, transported, and/or are mostly covered with impervious surfaces such as buildings, pavement, industrial parks, and railroad yards. The Surficial Geologic Map of New York – Niagara Sheet (1988) indicates that the overburden underlying the Site consists of lacustrine silt and clay, which is generally laminated silt and clay, deposited in proglacial lakes.

According to the United States Geological Survey (USGS) Geological Map of New York Niagara Sheet (1970), the underlying bedrock formation at the Site consists of the Onondaga Limestone Seneca, Morehouse (cherty), and Clarence Limestone Members, Edgecliff cherty Limestone Member, local coral bioherms; Bois Blanc Limestone. Bedrock was not encountered during intrusive work conducted as part of the RI or the February 2019 Phase II ESA.

The Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map of the area indicates that the Site is within the 100 and 500-year floodplains.

The NYSDEC Freshwater Wetland Map and the United States Department of Interior Fish and Wildlife Service National Wetlands Inventory Map for the Site were reviewed. No state wetlands or federally designated wetlands are located on or adjoining the Site.

6.1.1 Site Conditions

At the time of LaBella's initial RI field activities in September 2022, Building 1 was operated as a truck maintenance garage, truck washing station, and office. The west portion of Building 2 was vacant and the east portion of Building 2 was utilized as a storage area for truck parts, empty drums, and old vehicles. A site visit was conducted by LaBella on May 21, 2024 to establish the conditions within the Site Buildings and the condition of the retaining wall located along the east Site boundary along the Buffalo River. In addition, a supplemental Site visit was conducted by LaBella with NYSDEC representatives on May 30, 2024. The collective observations from the May 2024 site visits are detailed below and the photographs collected are included in Appendix 8.

- Operations consistent with truck maintenance and repair was observed within the Site Buildings; however, the quantity of hazardous substances and petroleum product typically associated with the truck maintenance and repair operation was significantly less than that often associated with similar operations. Hazardous substances and petroleum products stored generally consisted of small quantities of maintenance fluids, two drums of oil/grease, one parts washer, and one portable used oil AST.
- Oil-Water Separator 1 is located immediately proximate the northeast exterior of Building 1. Features observable at the ground surface associated with Oil-Water Separator 1 includes a circular steel "manhole" installed within a concrete pad.
- No evidence of poor housekeeping or the release of hazardous substances or petroleum products were observed within the interior of Building 1 or Building 2. It should be noted that the housekeeping at the Site observed by LaBella is consistent with the conditions reported within the November 2018 Phase I ESA which reported no concerns (staining, odors, etc.) proximate the drains interior floor drains.

- Floor drains within Building 1 consist of a trench drain located within the central portion of Building 1 previously utilized for truck maintenance and a trench drain and square floor drain located within the east portion of Building 1 previously utilized for truck washing. Based on the results of the geophysical survey (refer to Section 5.1), it appears that the floor drains located within Building 1 discharge through Oil-Water Separator 1 located proximate the north exterior of Building 1 to the municipal sewer system.
- One pipe of unknown nature was observed protruding from the east exterior wall of Building 1 traveling vertically along the east interior wall of Building 1 and entering the interior concrete floor. It should be noted that the pipe of unknown nature was assessed/traced within the geophysical survey scope of work detailed within Section 5.1. Although the exact nature of the pipe was not confirmed, based on the results of the geophysical survey, it appears that the pipe of unknown nature may be associated with Suspect Oil-Water Separator 2 located beneath the northeast portion of Building 1. As such, the pipe of unknown nature does not appear to be of environmental concern at this time.
- Three apparent metal pipes consistent with bollards were identified north of Building 2 and immediately south adjacent to the north Site boundary. The location of the bollards is consistent with the reported location of a gasoline pump dispenser identified within Figure 2 of the February 2019 Phase II ESA included within Appendix 2. Based on the results of the geophysical survey (refer to Section 5.1), no subsurface structures or anomalies consistent with orphaned UST or ancillary systems were identified adjacent to the bollards. It should be noted that subsurface conditions adjacent the suspect bollards was assessed through investigation locations SB-8/SB-8W and SB-30/MW-4.
- Two piles of gravel were noted located on the central portion of the Site immediately east adjacent to the Site boundary along Ganson Street. At the time of the site visits, the source and nature of the gravel piles were not known; however, after subsequent evaluation, it was determined that the gravel piles were unknowingly imported to the Site by George W. Burnett Inc. (i.e. tenant/truck maintenance operation) in August 2020. At the request of the NYSDEC, a formal Request to Import/Reuse Fill or Soil was submitted to the NYSDEC on June 17, 2024. A copy of the Request to Import/Reuse Fill or Soil is included in Appendix 1. Subsequently, LaBella visited the Site on March 28, 2025 and noted that the gravel piles were no longer present at the Site. Inquiries with Mr. Joe Carruba revealed that Mr. Carruba had no knowledge that the gravel was removed from the Site. LaBella contacted Mr. Eric Bauer with George W. Burnett Inc., the former site tenant, on March 3, 2025 who reported approximately 80% of the gravel was exported from the Site for construction of a residential driveway, approximately 10% was exported for unknown use to a private individual, and approximately 10% was used on-site to fill “pot holes”. LaBella returned to the Site on March 4, 2025 to observe the conditions proximate the former location of the gravel piles. Photographs of the conditions observed are included in Appendix 8. No evidence suggesting subsurface soil was disturbed, excavated, or inadvertently exported during the gravel removal activities implemented by George W. Burnett Inc. was observed.
- One 10,000-gallon diesel AST was located north of Building 1. The AST was actively being used by the Site tenant George W. Burnett Inc. to fuel vehicles associated with truck repair operations. The AST appeared to be in good condition; however, a small area of surface stained soil was observed immediately east of the AST, presumably the result of minor spills of diesel fuel during diesel product delivery (i.e. filling the AST) considering the fill port of the AST is proximate this location. The AST was removed from the Site on October 8, 2024 and subsequent investigation of the subsurface conditions proximate the AST completed on October 17, 2024. Refer to Section 5.2 for additional information related to removal of the 10,000-gallon AST. A copy of the AST Closure Report is included in Appendix 7.

- LaBella conducted a visual inspection of the concrete retaining wall located along the southeast Site Boundary along the Buffalo River. Based on the visual observations, the concrete retaining appeared to be in good condition. No evidence of failure was observed.

It should be noted that the George W. Burnett Inc. tenant/truck maintenance operation vacated the Site in the Fall of 2024 and it is LaBella's understanding that the Site is currently unoccupied.

6.2 Geology

Based on the collective subsurface conditions observed within the soil borings and test pits advanced at the Site associated with the 2019 Phase II ESA and the RI, fill material consisting of concrete, asphalt/pavement, brick, gravel, coal, wood, railroad ties, rebar, ash, glass, silt, sand, and clay extending to a maximum depth of approximately between approximately 7.5 and 10 ft bgs within soil borings SB-1, SB-2, SB-17, SB-18, SB-22, SB-23, SB-26 generally overlays the Site. However, with the exception of the soil boring locations SB-1, SB-2, SB-17, SB-18, SB-22, SB-23, SB-26, fill material generally extended to maximum depths of between approximately 1.5 and 6 ft bgs on the north portion of the Site, and between approximately 2 and 5.5 ft bgs on the south portion of the Site. Slag was encountered within the fill material in soil boring SB-27 and test pit excavations TP-11, TP-12, TP-17, TP-18, TP-19, TP-20, and TP-21 to a maximum depth of approximately 5 ft bgs. Fill material including a tire and a plastic tarp was encountered within TP-10 to a maximum depth of 5 ft bgs. Native material consisting of gravel, sand, silt, and clay was encountered beneath the fill layer extending to a maximum depth of approximately 16 ft bgs. Saturated conditions were generally encountered during advancement of soil borings and test pit excavations between approximately 2 and 10 ft bgs.

6.3 Hydrogeology

Hydrogeologic conditions at the Site were evaluated through collection of groundwater data from groundwater monitoring wells MW-1 through MW-8. It should be noted that groundwater monitoring wells MW-1 and MW-2 were installed by others prior to RI activities implemented by LaBella; however, groundwater monitoring wells MW-3 through MW-4 were installed in September 2022. Additional information regarding installation of the monitoring wells is located in Section 4.1.3 and 4.1.4. Static water level measurements were taken from the monitoring wells on September 14, 2022. It should be noted, as detailed within Section 4.1.4, the groundwater elevation within MW-1 could not be measured due to the presence of an obstruction in the well.

These static water level measurements were measured in feet above mean sea level (ft AMSL) and are shown in the table below. The depth to groundwater measured in the wells ranged from between 2.11 and 9.39 feet from the top of the well risers.

Summary of Monitoring Well Static Groundwater Measurements

Monitoring Well ID	Total Depth of Well (ft)	Elevation of Top of Riser (ft AMSL)	Static Water Level (ft from top of Riser)	Groundwater Elevation (ft AMSL)
MW-1	NM*	584.88	NM*	NM*
MW-2	19.20	585.07	9.39	575.68
MW-3	14.50	581.13	5.33	575.80
MW-4	11.40	581.61	2.11	579.50
MW-5	14.70	581.65	9.68	576.97
MW-6	14.70	579.04	6.35	572.69
MW-7	14.65	580.62	6.82	573.80
MW-8	15.00	579.39	6.71	572.68

*-Measurement from MW-1 was not obtained due to an obstruction in the well

Elevations were determined by surveying the top of the groundwater monitoring well risers and obtaining the static water level readings from within each groundwater monitoring well at the Site. A groundwater contour map is included as Figure 5. Review of the groundwater contour map and static water levels recorded in the monitoring wells indicates that the gradient of the groundwater potentiometric surface across the Site is generally to the south-southeast.

Buffalo River elevation data retrieved from the National Oceanic and Atmospheric Administration (NOAA) Tides and Currents Website (https://tidesandcurrents.noaa.gov/) collected from Station ID: 9063020 located approximately 1.3-miles downstream of the Site reported a mean surface elevation of 572.52 ft on September 14, 2024. Buffalo River elevation data for the seven day period starting September 11, 2022 and ending September 17, 2022 reported a minimum mean of 572.14 ft and a maximum mean of 572.62 ft. Groundwater elevation recorded in the groundwater monitoring wells installed at the Site appear higher than the elevations reported in Buffalo Creek for the dates elevation data was retrieved. It should be noted that the Buffalo River elevation data was recorded within the International Great Lakes Datum of 1985, which according to NOAA, is an equivalent of ft AMSL. Information retrieved from NOAA is included within Appendix 11.

Although construction drawings are unavailable for the concrete retaining wall and the actual structure of the retaining wall is unknown, concrete retaining walls along rivers are often constructed with a toe-footer extending perpendicular to the retaining wall matching the river bed elevation. Considering this typical construction design and the apparent good condition of the concrete retaining wall at the Site, groundwater and river water may have the opportunity to exchange through retaining wall joints or through the concrete due to concretes porous structure. Water bearing zones located at an elevation beneath the tow-footing may more readily exchange groundwater depending on greater regional groundwater flow and alternating hydrostatic pressure associated with water level fluctuations in the Buffalo River.

7.0 FIELD SCREENING RESULTS AND EVIDENCE OF IMPAIRMENT

The following subsections present and discuss the results of organic vapor field screening and CAMP results conducted during the RI program, as well as visual and olfactory evidence of impairment noted during the field program.

7.1 Organic Vapor Screening Results

Direct screening of subsurface soil/fill samples collected from the test pits and soil borings advanced as part of the RI for TOVs was conducted using a PID and the resulting measurements were recorded on the field logs. TOV measurements were generally at background levels (less than 1 ppm) with the exception of the following.

- TP-1 exhibited a PID reading of 41.9 ppm from 3-6 ft bgs.
- TP-2 exhibited a PID reading of 1.2 ppm from 2-5 ft bgs.
- TP-6 exhibited a PID reading of 1.7 ppm.
- TP-25 exhibited a PID a peak PID reading of 87.9 ppm from 2-3 ft bgs.
- TP-26 exhibited a peak PID reading of 5 ppm from 4-5 ft bgs.
- TP-27 exhibited a PID reading of 3.5 ppm from 2-3 ft bgs.
- TP-28 exhibited a PID reading of 3.5 ppm from 2-3 ft bgs.
- SB-25 exhibited a peak PID reading of 55.8 ppm from 5-6.3 ft bgs.
- SB-27 exhibited a peak PID reading of 5.5 ppm from 3-3.5 ft bgs.

PID readings were considered when selecting soil samples for laboratory analysis. Subsurface logs detailing the observations collected during advancement of the test pits and soil borings are included in Appendix 3. Table 1A summarizes the subsurface conditions encountered and the laboratory analysis performed.

7.2 Visual/Olfactory Evidence of Impairment

Visual and/or olfactory evidence of impairment, including staining and odor, was assessed during the advancement of the soil borings and test pits advanced as part of the RI, and was noted on the subsurface logs. Based on the field observations, no field evidence of impact was encountered within the test pits of soil borings advanced as part of the RI the exception of the following.

- TP-1 exhibited suspect petroleum-type odors within soil collected from the ground surface to 3 ft bgs.
- TP-6 exhibited slight suspect petroleum-type odor within soil collected from 0-3 ft bgs.
- TP-25 exhibited suspect petroleum-type odors and staining within soil collected from the ground surface to 6 ft bgs.

Generally, the soil samples detailed above also exhibited elevated PID readings.

Visual and olfactory evidence of impact was considered when selecting soil samples for laboratory analysis. Subsurface logs detailing the observations collected during advancement of the test pits and soil borings are included in Appendix 3. Table 1A summarizes the subsurface conditions encountered and the laboratory analysis performed.

7.3 Community Air Monitoring Results

Continuous community air monitoring was performed during the September 2022 intrusive activities, and during the October 2024 test pit investigation and AST closure. Community air monitoring included monitoring air for particulates at both locations upwind and downwind portions of the Site. Upwind and downwind monitoring locations for both particulates and VOCs were selected based on prevailing wind conditions during the investigation activities. Particulate monitoring was conducted using TSI 8530 DustTrak II aerosol monitors equipped with data-logging function in accordance with the CAMP. No exceedances of the CAMP action levels were recorded at the downwind locations during the course of these RI field activities at the Site. It should be noted that during the soil boring activities the DustTrack meter was experiencing technical difficulties. Also, during the first two days of test pit activity, the task was completed during inclement weather and the meters were not deployed. The community air monitoring results are included in Appendix 9. VOC monitoring and screening of soils recovered from test pits and soil borings were recorded on field logs included in Appendix 3. Methods to control dust and dirt were not necessary at the Site during RI field activities.

8.0 ANALYTICAL RESULTS

The following sections summarize and discuss the analytical results generated during the RI. Surface and subsurface soil/fill, native soil, soil vapor, and groundwater samples were collected for chemical analysis to evaluate the magnitude and extent of potential contamination occurring at the Site. A summary of the RI sampling program as well as the number and type of QA/QC samples is presented in Table 1A and 1B. Tables 2 through 6 summarize the results of the laboratory analysis with the final validation qualifiers for the surface soil/fill, subsurface soil/fill, groundwater, and soil vapor samples, respectively, and compare the results to the applicable SCGs described in Section 3.0. The laboratory analytical reports are included in Appendix 4.

With the exception of the soil samples collected from the test pits advanced in October 2024 (TP-25 through TP-28), laboratory data was validated in accordance with NYSDEC guidelines and was qualified, where appropriate, based on the data usability evaluation. Qualifier codes were used to indicate the qualitative and quantitative reliability of the data. All analytical laboratory data were found to be valid and usable with the qualifications noted in the DUSRs with the exception of the following:

- The herbicide fraction result for pentachlorophenol in one sample was rejected due to an apparent matrix effect.
- Numerous SVOC TICs in most of the samples were considered external laboratory contamination and were removed as sample components.
- Chloroform in samples reported in Sample Delivery Groups (SDGs) 480-201357-1 and 480-201621-1 were edited to reflect non-detect due to presence in the associated method blanks.
- Toluene in all samples reported in SDGs 480-201357-1 [except SB-25 (4-6')] were edited to reflect non-detect due to presence in the associated method blanks.
- Butylbenzylphthalate in samples reported in SDGs 480-201432-1 were edited to reflect non-detect due to presence in the associated method blanks.
- Diethylphthalte in samples reported in SDG 480-201621-1, 480-201794-1 and 480-202112-1 were edited to reflect non-detect due to presence in the associated method blanks.
- Many detected pesticides were edited to reflect non-detect due to results exhibiting elevated dual column quantitative correlations.
- 4,4'-DDD and endrin aldehyde in samples reported in SDG 480-201357-1 were edited to reflect non-detect due to presence in the associated method blanks.

- PFOS in MW-8, PFBA in MW-5 and DUP, perfluorohexanoic acid (PFHxA) and perfluorobutanesulfonic acid (PFBS) in MW-6, and PFBS in MW-5 and DUP are considered to be Estimated Maximum Possible Concentrations (EMPC) due to outlying ion ratios.
- Perfluorodecanic acid (PFDA), PFHxA, and perfluorooctanoic acid (PFOA) in SDG 480-201621-1 were edited to reflect non-detect due to external contamination during re-extraction process.

Consistent with NYSDEC guidelines, the ASP Category B deliverables are not presented as appendices to the RI Report. The data will be transmitted electronically to the NYSDEC in a format consistent with the Electronic Data Deliverable (EDD) Manual.

8.1 Surface Soil/Fill

Four surface soil/fill samples were collected and submitted for laboratory analysis as part of the RI. The laboratory results are included within Appendix 4, and the results are summarized within Table 2. The surface soil/fill sample locations are depicted on Figure 3. VOCs, SVOCs, PFAs, pesticides and metals were not detected within the surface soil/fill samples collected from the Site at concentrations exceeding the SCGs utilized in implementation of the RI with the exception of the following.

Metals exceeding the SCGs utilized in implementation of the RI are listed below:

- Arsenic was detected within surface soil/fill sample SS-1 at a concentration of 16.6 milligrams per kilogram (mg/kg) exceeding its respective Unrestricted Use SCO (13 mg/kg), Restricted Residential Use SCO (16 mg/kg), and Commercial Use SCO (16 mg/kg).
- Total chromium was detected within surface soil/fill samples SS-1, SS-2, and SS-3 at concentrations of 151 mg/kg, 151 mg/kg, and 42.6 mg/kg, respectively. These concentrations all exceed the Unrestricted SCO of 1 mg/kg for hexavalent chromium and 30 mg/kg for trivalent chromium; however, only the soil sample collected from SS-2 exhibited a concentration of total chromium exceeding the Restricted Residential Use SCO for hexavalent chromium of 110 mg/kg. It should be noted that that a total chromium concentration of 384 mg/kg was detected within soil/fill sample DUP-2 (duplicate sample of SS-1). This concentration of total chromium exceeds the Unrestricted SCO of 1 mg/kg for hexavalent chromium and 30 mg/kg for trivalent chromium, and the Restricted Residential Use SCO of 110 mg/kg for hexavalent chromium and 180 mg/kg for trivalent chromium. None of the concentrations of total chromium detected within the surface soil/fill samples exceeded their respective Commercial Use SCOs.
- Copper was detected within surface soil/fill samples collected from SS-1, DUP-2 (SS-1), SS-2, and SS-3 at concentrations of 76.5 mg/kg, 63.1 mg/kg, 74.6 mg/kg, and 58.2 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO for copper of 50 mg/kg; however, do not exceed the Restricted Residential or Commercial Use SCO for copper of 270 mg/kg.
- Lead was detected within surface soil/fill samples collected from SS-1, DUP-2 (SS-1), SS-2, and SS-3 at concentrations of 78.5 mg/kg, 114 mg/kg, 134 mg/kg, and 253 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO for lead of 63 mg/kg; however, do not exceed the Restricted Residential Use SCO for lead of 400 or the Commercial Use SCO for lead of 1,000 mg/kg.
- Manganese was detected within surface soil/fill samples collected from SS-1, DUP-2 (SS-1), SS-2, and SS-3 at concentrations of 2,110 mg/kg, 7,190 mg/kg, 3,080 mg/kg, and 2,280 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO for manganese of 1,600 mg/kg and the Restricted Residential Use SCO for manganese of 2,000; however, do not exceed the Commercial Use SCOs for manganese of 10,000 mg/kg.
- Nickel was detected within surface soil/fill samples collected from SS-1 and DUP-2 (SS-1) at concentrations of 38.7 mg/kg and 33.6 mg/kg, respectively. These concentrations exceed the

Unrestricted Use SCO for nickel of 30 mg/kg; however, do not exceed the Restricted Residential of Commercial Use SCO for nickel of 310 mg/kg.

- Selenium was detected within surface soil/fill samples collected from SS-1 and DUP-2 (SS-1) at concentrations of 4.1 mg/kg and 5.9 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO for selenium of 3.9 mg/kg; however, do not exceed the Restricted Residential Use SCO for selenium of 180 mg/kg or the Commercial Use SCO for selenium of 1,500 mg/kg.
- Zinc was detected within surface soil/fill samples collected from SS-2 and SS-3 at concentrations of 210 mg/kg and 121 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO for zinc of 109 mg/kg; however, do not exceed the Restricted Residential or Commercial Use SCO for zinc of 10,000 mg/kg.

SVOCs exceeding the SCGs utilized in implementation of the RI are listed below:

- Benzo(a)anthracene was detected within the surface soil/fill sample collected from SS-2 at a concentration of 1.9 mg/kg, exceeding the Unrestricted and Restricted Residential Use SCO of 1 mg/kg; however, below the Commercial Use SCO of 5.6 mg/kg.
- Benzo(a)pyrene was detected within the surface soil/fill samples collected from SS-2 and SS-3 at concentrations of 2.4 mg/kg and 1.5 mg/kg, respectively. These concentrations exceed the Unrestricted, Restricted Residential, and Commercial Use SCO of 1 mg/kg.
- Benzo(b)fluoranthene was detected within the surface soil/fill samples collected for SS-2 and SS-3 at concentrations of 3.1 mg/kg and 1.8 mg/kg, respectively. These concentrations exceed the Unrestricted and Restricted Residential Use SCO of 1 mg/kg; however, do not exceed the Commercial Use SCO of 5.6 mg/kg.
- Benzo(k)fluoranthene was detected within surface soil/fill samples collected from SS-2 and SS-3 at concentrations of 1.1 mg/kg and 0.94 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO of 0.8 mg/kg; however, do not exceed the Restricted Residential Use SCO of 3.9 mg/kg or the Commercial Use SCO of 56 mg/kg.
- Chrysene was detected within the surface soil/fill sample collected from SS-2 and SS-3 at concentrations of 2.1 mg/kg and 1.3 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO of 1 mg/kg; however, do not exceed the Restricted Residential Use SCO of 3.9 mg/kg or the Commercial Use SCO of 56 mg/kg.
- Dibenzo(a,h)anthracene was detected within surface soil/fill samples collected from SS-2 and SS-3 at a concentration of 0.42 mg/kg; exceeding the Unrestricted and Restricted Residential Use SCO of 0.33 mg/kg; however, below the Commercial Use SCO of 0.56 mg/kg.
- Indeno(1,2,3-cd)pyrene was detected within surface soil/fill samples collected from SS-2 and SS-3 at concentrations of 1.9 mg/kg and 1.4 mg/kg, respectively. These concentrations exceed the Unrestricted and Restricted Residential Use SCO of 0.5 mg/kg; however, are below the Commercial Use SCO of 5.6 mg/kg.

Pesticides exceeding the SCGs utilized in implementation of the RI are listed below:

- 4,4'-DDD was detected within the surface soil sample collected from SS-2 at a concentration of 0.012 mg/kg, exceeding the Unrestricted Use SCO of 0.0033 mg/kg; however, below the Restricted Residential Use SCO of 13 mg/kg and the Commercial Use SCO of 92 mg/kg.

8.2 Subsurface Soil/Fill

A total of 39 subsurface soil/fill (29 test pit and 10 soil boring) samples were collected and submitted for laboratory analysis as part of the RI. The laboratory results are included within Appendix 4, and the results

are summarized within Table 3A, 3B, and 4B. The subsurface soil/fill sample locations are depicted on Figure 3. No analytes were detected within the subsurface soil/fill samples collected from the Site at concentrations exceeding the SCGs utilized in implementation of the RI with the exception of the following.

VOCs exceeding the SCGs utilized in implementation of the RI are listed below:

- Acetone was detected within the subsurface soil/fill sample collected from TP-1, TP-25 (2-3 ft bgs), TP-25 (6-7 ft bgs), TP-26, and SB-26 at concentrations of 0.75 mg/kg, 0.061 mg/kg, 0.072 mg/kg, 0.099 mg/kg, and 0.072 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO of 0.05 mg/kg; however, are below the Restricted Residential Use SCO of 100 mg/kg and the Commercial Use SCO of 500 mg/kg.
- Methyl ethyl ketone was detected within the subsurface soil/fill sample collected from TP-1 and TP-26 at a concentration of 0.14 mg/kg and 0.021 mg/kg, respectively. These concentrations exceed the Unrestricted Use SCO of 0.12 mg/kg; however, are below the Restricted Residential Use SCO of 100 mg/kg and the Commercial Use SCO of 500 mg/kg.
- Methylene chloride was detected within the subsurface soil/fill sample collected from TP-27 at a concentration of 0.12 mg/kg, exceeding the Unrestricted Use SCO of 0.05 mg/kg; however, below the Restricted Residential Use SCO of 100 mg/kg and the Commercial Use SCO of 500 mg/kg.
- 1,2,4-trimethylbenzene was detected in the subsurface soil/fill sample collected from SB-31 at a concentration of 4.3 mg/kg, exceeding the Unrestricted Use SCO of 3.6 mg/kg; however, below the Restricted Residential Use SCO of 52 mg/kg and the Commercial Use SCO of 190 mg/kg.
- Benzene was detected within the subsurface soil/fill sample collected from SB-25 at a concentration of 0.14 mg/kg, exceeding the Unrestricted Use SCO of 0.06 mg/kg; however, below the Restricted Residential Use SCO of 4.8 mg/kg and the Commercial Use SCO of 44 mg/kg.
- Toluene was detected within subsurface soil/fill sample collected from SB-25 at a concentration of 1 mg/kg, exceeding the Unrestricted Use SCO of 0.7 mg/kg; however, below the Restricted Residential Use SCO of 100 mg/kg and the Commercial Use SCO of 500 mg/kg.
- Total xylenes were detected within the subsurface soil/fill sample collected from SB-25 at a concentration of 3.69 mg/kg, exceeding the Unrestricted Use SCO of 0.26 mg/kg; however, below the Restricted Residential Use SCO of 100 mg/kg and the Commercial Use SCO of 500 mg/kg.

SVOCs exceeding the SCGs utilized in implementation of the RI are listed below:

- Benzo(a)anthracene was detected within the subsurface soil/fill samples collected from TP-1 (2.7 mg/kg), TP-2 (16 mg/kg), TP-4 (2.3 mg/kg), TP-6 (46 mg/kg), TP-7(27 mg/kg), TP-8 (2.3 mg/kg), TP-9 (10 mg/kg), TP-11 (2.6 mg/kg), TP-12 (9.8 mg/kg), TP-13 (1.6 mg/kg), TP-17 (2 mg/kg), TP-20 (1.2 mg/kg), TP-28 (1.4 mg/kg), SB-27 (2.5 mg/kg), SB-29 (31 mg/kg), and DUP-1/SB-27 (5.4 mg/kg).
    - The concentrations of benzo(a)anthracene detected within TP-1, TP-4, TP-8, TP-11, TP-13, TP-17, TP-20, TP-28, SB-27, and DUP-1/SB-27 exceed the Unrestricted and Restricted Residential Use SCO of 1 mg/kg; however, do not exceed the Commercial Use SCO of 5.6 mg/kg.
    - The concentrations of benzo(a)anthracene detected within TP-2, TP-6, TP-7, TP-9, TP-12, and SB-29 exceed the Unrestricted and Restricted Residential Use SCO of 1 mg/kg and the Commercial Use SCO of 5.6 mg/kg.
- Benzo(a)pyrene was detected within the subsurface soil/fill samples collected from TP-1 (2.1 mg/kg), TP-2 (18.0 mg/kg), TP-4 (2.7 mg/kg), TP-6 (45 mg/kg), TP-7 (27 mg/kg), TP-8 (2.5 mg/kg), TP-9 (12 mg/kg), TP-11 (2.7 mg/kg), TP-12 (9.6 mg/kg), TP-13 (1.7 mg/kg), TP-17 (1.9 mg/kg), TP-

20 (1.3 mg/kg), TP-28 (1.3 mg/kg), SB-27 (2.2 mg/kg), SB-29 (42 mg/kg), and DUP-1/SB-27 (4.8 mg/kg) at concentrations exceeding the Unrestricted, Restricted Residential, and Commercial Use SCO of 1 mg/kg.

- Benzo(b)fluoranthene was detected within the subsurface soil/fill samples collected from TP-1 (2.2 mg/kg), TP-2 (20 mg/kg), TP-4 (3.5 mg/kg), TP-5 (1.1 mg/kg), TP-6 (49 mg/kg), TP-7 (27 mg/kg), TP-8 (3 mg/kg), TP-9 (14 mg/kg), TP-11 (3 mg/kg), TP-12 (9.3 mg/kg), TP-13 (2.2 mg/kg), TP-17 (2.3 mg/kg), TP-19 (1.1 mg/kg), TP-20 (2.1 mg/kg), TP-28 (1.5 mg/kg), SB-27 (2.4 mg/kg), SB-29 (52 mg/kg), and DUP-1/SB-27 (5.2 mg/kg).
    - The concentrations of benzo(b)fluoranthene detected within TP-1, TP-4, TP-5, TP-8, TP-11, TP-13, TP-17, TP-19, TP-20, TP-28, SB-27, and DUP-1/SB-27 exceed the Unrestricted and Restricted Residential Use SCO of 1 mg/kg; however, do not exceed the Commercial Use SCO of 5.6 mg/kg.
    - The concentrations of benzo(b)fluoranthene detected within TP-2, TP-6, TP-7, TP-9, TP-12, and SB-29 exceed the Unrestricted and Restricted Residential Use SCO of 1 mg/kg, and the Commercial Use SCO of 5.6 mg/kg.
- Benzo(k)fluoranthene was detected within the subsurface soil/fill samples collected from TP-1 (1.2 mg/kg), TP-2 (11 mg/kg), TP-4 (1.6 mg/kg), TP-6 (18 mg/kg), TP-7 (13 mg/kg), TP-8 (1.1 mg/kg) TP-9 (4.5 mg/kg), TP-11 (1.3 mg/kg), TP-12 (4.6 mg/kg), TP-13 (0.94 mg/kg), TP-17 (0.95 mg/kg), SB-27 (1.1 mg/kg), SB-29 (26 mg/kg), and DUP-1/SB-27 (2.4 mg/kg).
    - The concentrations of benzo(k)fluoranthene detected within TP-1, TP--4, TP-8, TP-11, TP-13, TP-17, SB-27, and DUP-1/SB-27 exceed the Unrestricted Use SCO of 0.8 mg/kg; however, do not exceed the Restricted Residential Use SCO of 3.9 mg/kg or the Commercial Use SCO of 56 mg/kg.
    - The concentrations of benzo(k)fluoranthene detected within TP-2, TP-6, TP-7, TP-9, TP-12, and SB-29 exceed the Unrestricted Use SCO of 0.8 mg/kg and the Restricted Residential Use SCO of 3.9 mg/kg; however, do not exceed the Commercial Use SCO of 56 mg/kg.
- Chrysene was detected within the subsurface soil/fill samples collected from TP-1 (2.7 mg/kg), TP-2 (17 mg/kg), TP-4 (2.8 mg/kg), TP-5 (1 mg/kg), TP-6 (45 mg/kg), TP-7 (28 mg/kg), TP-8 (2.4 mg/kg), TP-9 (10 mg/kg), TP-11 (2.7 mg/kg), TP-12 (8.8 mg/kg), TP-13 (1.9 mg/kg), TP-17 (2.1 mg/kg), TP-20 (1.2 mg/kg), TP-28 (1.5 mg/kg), SB-27 (2.5 mg/kg), SB-29 (35 mg/kg), and DUP-1/SB-27 (5.7 mg/kg).
    - The concentrations of chrysene detected within TP-1, TP-4, TP-5, TP-8, TP-11, TP-13, TP-17, TP-20, TP-28, and SB-27 exceed the Unrestricted Use SCO of 1 mg/kg; however, do not exceed the Restricted Residential Use SCO of 3.9 mg/kg or the Commercial Use SCO of 56 mg/kg.
    - The concentrations of chrysene detected within TP-2, TP-6, TP-7, TP-9, TP-12, SB-29, and DUP-1/SB-27 exceed the Unrestricted Use SCO of 1 mg/kg and the Restricted Residential Use SCO of 3.9 mg/kg; however, do not exceed the Commercial Use SCO of 56 mg/kg.
- Dibenz(a,h)anthracene was detected within the subsurface soil/fill samples collected from TP-1 (0.39 mg/kg), TP-4 (0.45 mg/kg), TP-6 (7.7 mg/kg), TP-7 (4.4 mg/kg), TP-8 (0.51 mg/kg), TP-9 (1.3 mg/kg), TP-11 (0.42 mg/kg), TP-12 (1.6 mg/kg), SB-27 (0.39 mg/kg), SB-29 (7.9 mg/kg), and DUP-1/SB-27 (0.87 mg/kg).
    - The concentrations of dibenz(a,h)anthracene detected within TP-1, TP-4, TP-8, TP-11, and SB-27 exceed the Unrestricted and Restricted Residential Use SCO of 0.33 mg/kg; however, do not exceed the Commercial Use SCO of 0.56 mg/kg.

- The concentrations of dibenz(a,h)anthracene detected within TP-6, TP-7, TP-9, TP-12, SB-29, and DUP-1/SB-27 exceed the Unrestricted and Restricted Residential Use SCO of 0.33 mg/kg and the Commercial Use SCO of 0.56 mg/kg.

- Fluoranthene was detected within the subsurface soil/fill sample collected from TP-6 at a concentration of 100 mg/kg, which exceeds the Unrestricted and Restricted Residential Use SCO of 100 mg/kg; however, is below the Commercial Use SCO of 500 mg/kg.
- Indeno(1,2,3-c,d)pyrene was detected within the subsurface soil/fill sample collected from TP-1 (0.95 mg/kg), TP-2 (12 mg/kg), TP-4 (1.4 mg/kg), TP-5 (0.52 mg/kg), TP-6 (20 mg/kg), TP-7 (15 mg/kg), TP-8 (1.4 mg/kg), TP-9 (6.2 mg/kg), TP-11 (1.7 mg/kg),TP-12 (5.3 mg/kg), TP-13 (1.1 mg/kg), TP-17 (1.3 mg/kg), TP-19 (0.62 mg/kg), TP-20 (0.62 mg/kg), TP-28 (0.58 mg/kg), SB-27 (0.85 mg/kg), SB-29 (24 mg/kg), and DUP-1/SB-27 (2.1 mg/kg).
    - The concentrations of indeno(1,2,3-c,d)pyrene detected within TP-1, TP-4, TP-5, TP-8, TP-11, TP-12, TP-13, TP-17, TP-19, TP-20, TP-28, SB-27, and DUP-1/SB-27 exceed the Unrestricted and Restricted Residential Use SCO of 0.5 mg/kg; however, do not exceed the Commercial Use SCO for 5.6 mg/kg.
    - The concentrations of indeno(1,2,3-c,d)pyrene detected within TP-2, TP-6, TP-7, TP-9, and SB-29 exceed the Unrestricted and Restricted Residential Use SCO of 0.5 mg/kg and the Commercial Use SCO of 5.6 mg/kg.

Metals exceeding the SCGs utilized in implementation of the RI are listed below:

- Arsenic was detected within the subsurface soil/fill samples collected from TP-2 (22.9 mg/kg), TP-4 (18.3 mg/kg),TP-5 (27.4 mg/kg), TP-8 (13.5 mg/kg), TP-9 (15 mg/kg), TP-10 (15 mg/kg), TP-11 (21.9 mg/kg), TP-12 (17 mg/kg), TP-14 (19.5 mg/kg), TP-15 (13 mg/kg), TP-17 (13.2 mg/kg), TP-19 (13 mg/kg), TP-22 (18 mg/kg), TP-27 (18.5 mg/kg), SB-28 (19.5 mg/kg), and DUP-1/SB-27 (13.2 mg/kg).
    - The concentrations of arsenic detected within TP-8, TP-9, TP-10, TP-15, TP-17, TP-19, and DUP-1/SB-27 exceed the Unrestricted Use SCO of 13 mg/kg; however, do not exceed the Restricted Residential or Commercial Use SCO of 16 mg/kg.
    - The concentrations of arsenic detected within TP-2, TP-4, TP-5, TP-11, TP-12, TP-14, TP-22, TP-27, and SB-28 exceed the Unrestricted Use SCO of 13 mg/kg, and the Restricted Residential and Commercial Use SCO of 16 mg/kg.
- Barium was detected within the subsurface soil/fill samples collected from TP-12 (384 mg/kg) and TP-28 (597 mg/kg).
    - The concentration of barium detected in TP-12 exceeds the Unrestricted Use SCO of 350 mg/kg; however, is below the Restricted Residential and Commercial Use SCO of 400 mg/kg.
    - The concentration of barium detected in TP-27 exceeds the Unrestricted Use SCO of 350 mg/kg and the Restricted Residential and Commercial Use SCO of 400 mg/kg.
- Total chromium was detected within each subsurface soil/fill sample collected within the scope of this RI at concentrations of between 5.8 mg/kg and 33.9 mg/kg, exceeding one or both of the respective Unrestricted Use SCO for hexavalent chromium of 1 mg/kg or trivalent chromium of 30 mg/kg. Total chromium was not detected within any of the subsurface soil/fill samples collected at concentrations exceeding the respective Restricted Residential Use SCO for hexavalent chromium of 110 mg/kg or trivalent chromium of 180 mg/kg, or the Commercial Use SCO for hexavalent chromium of 400 mg/kg or trivalent chromium of 1,500 mg/kg.

- Copper was detected within subsurface soil/fill samples collected from TP-2 (99.5 mg/kg), TP-4 (58.6 mg/kg), TP-5 (158 mg/kg), TP-6 (188 mg/kg), TP-8 (127 mg/kg), TP-9 (67.9 mg/kg), TP-10 (79.9 mg/kg), TP-11 (215 mg/kg), TP-12 (209 mg/kg), TP-13 (136 mg/kg), TP-14 (95 mg/kg), TP-17 (150 mg/kg), TP-19 (60.8 mg/kg), TP-22 (75.8 mg/kg), TP-24 (50.7 mg/kg), SB-26 (55.5 mg/kg), SB-28 (67.4 mg/kg), and DUP-1/SB-27 (50.3 mg/kg) at concentrations exceeding the Unrestricted Use SCO of 50 mg/kg; however, below the Restricted Residential and Commercial Use SCO of 270 mg/kg.
- Lead was detected within subsurface soil/fill samples collected from TP-1 (247 mg/kg), TP-2 (601 mg/kg), TP-4 (316 mg/kg), TP-5 (341 mg/kg), TP-6 (190 mg/kg), TP-7 (482 mg/kg), TP-8 (301 mg/kg), TP-9 (188 mg/kg), TP-10 (156 mg/kg), TP-11 (373 mg/kg), TP-12 (519 mg/kg), TP-13 (538 mg/kg), TP-14 (149 mg/kg), TP-15 (67.9 mg/kg), TP-17 (2,810 mg/kg), TP-19 (85.4 mg/kg), TP-22 (130 mg/kg), TP-24 (68.5 mg/kg), TP-27 (114 mg/kg), TP-28 (420 mg/kg), SB-23 (92.7 mg/kg), SB-26 (333 mg/kg), SB-28 (824 mg/kg), SB-29 (118 mg/kg), and DUP-1/SB-27 (386 mg/kg).
    - The concentrations of lead detected within TP-1, TP-4, TP-5, TP-6, TP-8, TP-9, TP-10, TP-11, TP-14, TP-15, TP-19, TP-22, TP-24, TP-27, SB-23, SB-26, SB-29, and DUP-1/SB-27 exceed the Unrestricted Use SCO of 63 mg/kg; however, do not exceed the Restricted Residential Use SCO of 400 mg/kg or the Commercial Use SCO of 1,000 mg/kg.
    - The concentrations of lead detected within TP-2, TP-7, TP-12, TP-13, TP-28, and SB-28 exceed the Unrestricted Use SCO of 63 mg/kg and the Restricted Residential Use SCO of 400 mg/kg; however, do not exceed the Commercial Use SCO of 1,000 mg/kg.
    - The concentration of lead detected within TP-17 exceeds the Unrestricted Use SCO of 63 mg/kg, the Restricted Residential Use SCO of 400 mg/kg, and the Commercial Use SCO of 1,000 mg/kg.
- Manganese was detected within the subsurface soil/fill samples collected from TP-14 (10,600 mg/kg), TP-22 (1,870 mg/kg), and SB-23 (3,840 mg/kg).
    - The concentration of manganese detected within TP-22 exceeds the Unrestricted Use SCO of 1,600 mg/kg; however, does not exceed the Restricted Residential Use SCO of 2,000 mg/kg or the Commercial Use SCO of 10,000 mg/kg.
    - The concentration of manganese detected within SB-23 exceeds the Unrestricted Use SCO of 1,600 mg/kg and the Restricted Residential Use SCO of 2,000 mg/kg; however, does not exceed the Commercial Use SCO of 10,000 mg/kg.
    - The concentration of manganese detected within TP-14 exceeds the Unrestricted Use SCO of 1,600 mg/kg, the Restricted Residential Use SCO of 2,000 mg/kg, and the Commercial Use SCO of 10,000 mg/kg.
- Mercury was detected within the subsurface soil/fill samples collected from TP-1 (0.39 mg/kg), TP-2 (0.61 mg/kg), TP-4 (0.19 mg/kg), TP-5 (0.37 mg/kg) , TP-6 (0.27 mg/kg), TP-7 (0.91 mg/kg), TP-8 (0.31 mg/kg), TP-9 (0.21 mg/kg), TP-11 (0.28 mg/kg), TP-12 (0.23 mg/kg), TP-13 (0.5 mg/kg), TP-14 (0.38 mg/kg), TP-17 (0.33 mg/kg), TP-22 (0.39 mg/kg), TP-25 (0.25 mg/kg), SB-26 (1.9 mg/kg), SB-27 (0.29 mg/kg), SB-28 (0.68 mg/kg), SB-29 (0.2 mg/kg), and DUP-1/SB-27 (0.24 mg/kg).
    - The concentrations of mercury detected within TP-1, TP-2, TP-4, TP-5, TP-6, TP-8, TP-9, TP-11, TP-12, TP-13, TP-14, TP-17, TP-22, TP-25, SB-27, SB-28, SB-29, and DUP-1/SB-27 exceed the Unrestricted Use SCO of 0.18 mg/kg; however, do not exceed the Restricted Residential Use SCO of 0.81 mg/kg or the Commercial Use SCO of 2.8 mg/kg.

    - The concentrations of mercury detected within TP-7 and SB-26 exceed the Unrestricted Use SCO of 0.18 mg/kg and the Restricted Residential Use SCO of 0.81 mg/kg; however, do not exceed the Commercial Use SCO of 2.8 mg/kg.
- Nickel was detected with subsurface soil/fill samples collected from TP-2 (42.2 mg/kg), TP-5 (32 mg/kg), TP-12 (37.2 mg/kg), and SB-30 (30.8 mg/kg) at concentrations exceeding the Unrestricted Use SCO of 30 mg/kg; however, below the Restricted Residential and Commercial Use SCO of 310 mg/kg.
- Selenium was detected within subsurface soil/fill samples collected from TP-14 (5.2 mg/kg) and SB-25 (3.9 mg/kg) exceeding the Unrestricted Use SCO of 3.9 mg/kg; however, below the Restricted Residential Use SCO of 180 mg/kg and the Commercial Use SCO of 1,500 mg/kg.
- Zinc was detected within subsurface soil samples collected from TP-1 (133 mg/kg), TP-2 (455 mg/kg), TP-4 (229 mg/kg), TP-5 (498 mg/kg), TP-6 (581 mg/kg), TP-7 (122 mg/kg), TP-8 (188 mg/kg), TP-9 (219 mg/kg), TP-10 (267 mg/kg), TP-11 (147 mg/kg), TP-12 (188 mg/kg), TP-13 (377 mg/kg), TP-17 (129 mg/kg), TP-28 (149 mg/kg), SB-26 (109 mg/kg), SB-28 (264 mg/kg), SB-29 (109 mg/kg), and DUP-1/SB-27 (193 mg/kg) exceeding the Unrestricted Use SCO of 109 mg/kg; however, below the Restricted Residential and Commercial Use SCO of 10,000 mg/kg.

Pesticides exceeding the SCGs utilized in implementation of the RI are listed below:

- 4,4'-DDD was detected within the subsurface soil/fill samples collected from TP-2 (0.0084 mg/kg) and TP-9 (0.014 mg/kg) exceeding the Unrestricted Use SCO of 0.0033 mg/kg; however, below the Restricted Residential Use SCO of 13 mg/kg and the Commercial Use SCO of 92 mg/kg.
- 4,4'-DDE was detected within the subsurface soil/fill samples collected from TP-2 (0.0074 mg/kg), SB-25 (0.024 mg/kg), and SB-29 (0.094 mg/kg) exceeding the Unrestricted Use SCO of 0.0033 mg/kg; however, below the Restricted Residential Use SCO of 8.9 mg/kg and the Commercial Use SCO of 62 mg/kg.
- 4,4'-DDT was detected within the subsurface soil/fill samples collected from TP-2 (0.013 mg/kg) and TP-9 (0.027 mg/kg) exceeding the Unrestricted Use SCO of 0.0033 mg/kg; however, below the Restricted Residential Use SCO of 7.9 mg/kg and the Commercial Use SCO of 47 mg/kg.

8.3 Groundwater

Groundwater samples were collected from two existing and six new two-inch monitoring wells installed at the Site. The laboratory results are included within Appendix 4 and the results are summarized within Table 5. The well locations are depicted on Figure 3. No analytes were detected at concentrations exceeding the SCGs utilized in implementation of the RI with the exception of the following:

- Perfluorooctanoic acid (PFOA) was detected in the groundwater samples collected from MW-5 and DUP-1/MW-5 at a concentration of 15 nanograms per liter (ng/l), exceeding the groundwater NYSDEC TOGS 1.1.1 AWQS value of 6.7 ng/l.
- Perfluorooctanesulfonic acid (PFOS) was detected in the groundwater samples collected from MW-4 and MW-6 at respective concentrations of 8 ng/l and 3.4 ng/l, exceeding the groundwater NYSDEC TOGS 1.1.1 AWQS value of 2.7 ng/l.

8.4 Soil Vapor

Four soil vapor samples (SV-1 through SV-4) and one outdoor air sample (OA-1) were collected from the Site. The laboratory results are included within Appendix 4, and the results are summarized within Table 6. The soil vapor point locations are depicted on Figure 3.

Although the NYSDOH has not established guidance for analytes within soil vapor, for discussion purposes, below is a detailed review of the VOCs detected within the soil vapor samples collected from the Site for which the NYSDOH has established SCGs for soil vapor and indoor air.

- Benzene was detected within SV-1 [12 micrograms per cubic meter (ug/m^3)], SV-2 (5 ug/m^3), SV-3 (1.4 ug/m^3), SV-4 (0.86 ug/m^3), OA-1 (0.39 ug/m^3)
- Ethylbenzene was detected within SV-1 (2.4 ug/m^3), SV-2 (0.79 ug/m^3), and SV-3 0.43 ug/m^3).
- Cyclohexane was detected within SV-1 (14 ug/m^3), SV-2 (7.9 ug/m^3), SV-3 (1.7 ug/m^3), SV-4 (0.53 ug/m^3), and OA-1 (1.7 ug/m^3).
- 2,2,4-trimethylpentane was detected within SV-1 (1.7 ug/m^3), SV-2 (0.5 ug/m^3), and OA-1 (0.59 ug/m^3)
- 1,2,4-trimethylbenzene was detected within SV-1 (0.79 ug/m^3), SV-2 (0.93 ug/m^3), SV-3 (0.27 ug/m^3), SV-4 (0.42 ug/m^3), and OA-1 (0.55 ug/m^3).
- 1,3,5-trimethylbenzene was detected within SV-1 (0.26 ug/m^3) and SV-2 (0.31 ug/m^3).
- o-xylene was detected within SV-1 (1 ug/m^3), SV-2 (0.81 ug/m^3), and OA-1 (0.42 ug/m^3).
- m,p-xylene was detected within SV-1 (3.7 (ug/m^3), SV-2 (2.4 ug/m^3), SV-3 (1.2 ug/m^3), SV-4 (ug/m^3), and OA-1 (1.4 ug/m^3).
- n-Heptane was detected within SV-1 (17 ug/m^3), SV-2 (5.3 ug/m^3), SV-3 (1.2 ug/m^3), SV-4 (1.4 ug/m^3), and OA-1 (1.3 ug/m^3).
- n-Hexane was detected within SV-1 (17 ug/m^3), SV-2 (13 mg/m^3), SV-4 (1.1 ug/m^3), and OA-1 (1.7 ug/m^3).
- Toluene was detected with SV-1 (28 ug/m^3), SV-2 (13 ug/m^3), SV-3 (4.9 ug/m^3), SV-4 (4.8 ug/m^3), and OA-1 (2.1 ug/m^3).
- Methylene chloride was detected within SV-1 at a concentration of 2.9 ug/m^3.
- 1,1-dichloroethane (11-DCE) was detected within SV-1 at a concentration of 5.2 ug/m^3.
- Cis-1,2-dichloroethene (c12-DCE) was detected within SV-1 at a concentration of 0.37 ug/m^3.
- 1,1,1-Trichloroethane (111-TCA) was detected within SV-1 at a concentration of 56 ug/m^3.
- Carbon tetrachloride was detected within SV-2 (0.21 ug/m^3) and SV-4 (0.255 ug/m^3.
- Trichloroethene (TCE) was detected within SV-1 (6.7 ug/m^3), SV-2 (1.3 ug/m^3), and SV-3 (1.4 ug/m^3).
- Tetrachloroethene (PCE) was detected within SV-1 (11 ug/m^3), SV-2 (3 ug/m^3), SV-3 (2.9 ug/m^3), and SV-4 (0.34 ug/m^3).

It should be noted that only one location sampled for soil vapor (SV-1) identified one cVOC (PCE) at a concentration exceeding the most conservative NYSDOH Air Matrix sub-slab vapor value or the NYSDOH Table 3.1 revised Air Guidance Value.

9.0 CONTAMINATION ASSESSMENT

As indicated within Section 1.2, the Site has a long history of commercial and industrial operations including machine shops, tin shops, iron ore yards, railroads, a storage and repair shop for a disposal company, trucking companies with repair/washing, and construction companies since at least 1889. Organic and inorganic contaminants are present in soil, fill, and groundwater at the Site at concentrations that exceed the SCGs. Although Site redevelopment plans have not been finalized, it is anticipated that initial Site redevelopment will include a commercial mixed-use entertainment facility. There is the potential that multi-

family residential may be pursued at the Site in the future. Considering the collective results of the 2019 Phase II ESA and the results of the RI, this section provides an assessment of contaminants detected at the Site in excess of the SCGs applicable to each medium sampled.

9.1 Nature, Extent, and Source of Contamination

9.1.1 Surface Soil/Fill

Surface soil/fill samples collected from the Site generally exhibited concentrations of SVOCs and metals exceeding Unrestricted Use SCOs; however, only one surface soil/fill location (SS-2) exhibited concentrations of pesticides exceeding Unrestricted Use SCOs. Surface soil/fill samples collected from the Site generally exhibited concentrations of metals, and with the exception of SS-1, SVOCs at concentrations exceeding Restricted Residential Use SCOs. Only the surface soil/fill sample collected from SS-1 exhibited concentrations of metals (arsenic) exceeding Commercial Use SCOs. Although the source of the surface soil/fill contamination present at the Site cannot be confirmed, such is likely the result of historical commercial and industrial operations at the Site and the presence of urban fill material overlaying the Site. It should be noted that the Site is generally overlain with impervious asphalt and concrete surfaces and surface soil/fil is limited to a small area located proximate surface soil/fill samples collected. As such, it appears that surface soil/fill impact identified is restricted to the immediate vicinity of the surface soil/fill samples collected.

9.1.2 Subsurface Soil/Fill

As detailed within the 2019 Phase II ESA, and Section 4.1 and 7.0 of this report, soil collected from select soil borings and test pit excavations advanced at the Site exhibited suspect petroleum type-odors, suspect petroleum-type staining, and/or elevated PID readings (i.e. field evidence of impact); however, laboratory analysis of the soil/fill samples collected from the locations exhibiting the greatest field evidence of impact did not typically reveal concentrations of VOCs or SVOC exceeding Unrestricted, Restricted Residential, and Commercial Use SCOs. Rather, the soil/fill samples collected from the Site exhibiting the greatest exceedances were primarily related to SVOC and metals exceedances of Unrestricted, Restricted Residential, and Commercial Use SCOs which exhibited no visual or olfactory evidence of impact, and PID readings of between 0.0 ppm and 1.7 ppm. As example, soil/fill samples collected from TP-6, TP-7, SB-21, and SB-29 exhibited the highest total SVOC concentrations detected at the Site of 586.5 mg/kg, 326.3 mg/kg, 419.4 mg/kg, and 330.9 mg/kg, respectively. These soil/fill samples exhibited no visual or olfactory evidence of impact and PID readings of 0.0 ppm. In contrast, the soil samples exhibiting the greatest suspect petroleum type-odors, suspect petroleum-type staining, and PID readings (between 55.8 ppm and 87.9 ppm) were collected from TP-25, SB-2, and SB-25. Of these soil samples, SB-25 and TP-25 exhibited only select VOCs, pesticides, and metals at concentrations exceeding Unrestricted SCOs; however, no exceedances of Restricted Residential and Commercial Use SCOs. The soil sample collected from SB-2 did not exhibit any analytes exceeding Unrestricted, Restricted Residential, and Commercial Use SCOs. As such, it appears that the few investigation locations exhibiting field evidence of impact, including SB-2 associated with NYSDEC Spill Number 1810799, are limited in extent.

As discussed above, subsurface soil/fill samples collected from the Site generally exhibited concentrations of SVOCs and metals at concentrations exceeding Unrestricted, Restricted Residential, and Commercial Use SCOs. While the source of the surface soil/fill SVOC and metals contamination present at the Site cannot be confirmed, such is likely the result of historical commercial and industrial operations at the Site, the presence of urban fill material overlaying the Site, and to a lesser extent, historical petroleum bulk storage systems (i.e. ASTs/USTs) utilized at the Site. The extent of the SVOC and metal impact is expected to persist across the Site primarily confined to the fill layer extending to a maximum depth of approximately between approximately 7.5 and 10 ft bgs within soil borings SB-1, SB-2, SB-17, SB-18, SB-22, SB-23, SB-26. However, with the exception of those soil boring locations, fill material generally extends to maximum depths of

between approximately 1.5 and 6 ft bgs on the north portion of the Site, and between approximately 2 and 5.5 ft bgs on the south portion of the Site.

Subsurface soil/fill VOC impact slightly exceeding Unrestricted SCOs was limited to TP-2, SB-25, SB-26, and SB-31; however, no VOC impact was identified exceeding Restricted Residential or Commercial Use SCOs within the subsurface soil/fill samples collected. Subsurface soil/fill pesticide impact slightly exceeding Unrestricted SCOs was limited to TP-2, SB-25, and SB-29; however, no pesticide impact was identified exceeding Restricted Residential or Commercial Use SCOs within the subsurface soil/fill samples collected.

9.1.3 Groundwater

No contaminants of concern were identified within the groundwater samples collected from the Site at concentrations exceeding NYSDEC TOGS 1.1.1 AWQS, with the exception of PFOA detected within the groundwater sample collected from MW-5 and DUP-1/MW-5 and PFOS detected in the groundwater samples collected from MW-4 and MW-6. PFOA was detected within the groundwater sample collected from MW-5 and DUP-1/MW-5 at a concentration of 15 ng/l, exceeding the guidance value of 6.7 ng/l. PFOS was detected in the groundwater samples collected from MW-4 and MW-6 at respective concentrations of 8 ng/l and 3.4 ng/l, exceeding the groundwater NYSDEC TOGS 1.1.1 AWQS value of 2.7 ng/l. Considering that emerging contaminants have not been identified at concentrations exceeding NYSDEC TOGS 1.1.1 AWQS within any other groundwater samples collected from the Site, elevated concentrations of emerging contaminants were not identified within any of the surface and subsurface soil/fill samples collected from the Site, MW.4, MW-5, and MW-6 are located immediately adjacent to the Site boundary, and groundwater flow proximate appears to be to the south-southwest perpendicular to the east Site boundary, and slightly downgradient of the east north adjacent properties, the extent of the emerging contaminant groundwater impact appears to be limited in extent, and possibly originating from off-site.

9.1.4 Soil Vapor

Although the NYSDOH has not established guidance for analytes within soil vapor, only one location sampled for soil vapor (SV-1) identified one cVOC (PCE) at a concentration exceeding the most conservative NYSDOH Air Matrix sub-slab vapor value or the NYSDOH Table 3.1 revised Air Guidance Value. Based on the collective soil vapor results and the lack of significant VOC impact within soil/fill or groundwater at the Site, it appears that there is a low risk of soil vapor VOC impact on the south portion of the Site proximate SV-1.

9.2 Contaminant Fate and Transport

The probable fate and transport of contaminants detected on the Site is a function of the properties of the individual contaminants and available pathways for the contaminants to migrate. Although Site redevelopment plans have not been finalized, it is anticipated that initial Site redevelopment will include a commercial mixed-use entertainment facility. There is the potential that multi-family residential may be pursued at the Site in the future. The degree to which, as well as the route by which, contaminants migrate is dependent on the physical characteristics of the Site and the type and distribution of contaminants. The following sections discuss the probable fate and transport of contaminants in the different types of subsurface media at the Site.

9.2.1 Surface Soil/Fill

Contaminants of concern detected in the surface soil/fill primarily consist of SVOCs and metals, and to a lesser extent pesticides. The pesticides, SVOCs, and metals identified at the Site are characterized by low solubilities and are not expected to impact groundwater quality or migrate substantially into the subsurface. This is supported by the lack of these analytes in the on-Site groundwater. In addition, the low permeability

of the lacustrine deposits that underlie the Site are likely to minimize the downward migration of impact present at the Site.

9.2.2 Subsurface Soil/Fill

Contaminants of concern detected in the surface soil/fill primarily consist of SVOCs and metals, and to a lesser extent pesticides. The pesticides, SVOCs, and metals identified at the Site are characterized by low solubilities and are not expected to impact groundwater quality or migrate substantially into the subsurface. This is supported by the lack of these analytes in the on-Site groundwater. In addition, the low permeability of the lacustrine deposits that underlie the Site are likely to minimize the downward migration of impact present at the Site.

Five VOCs (acetone, toluene, total xylenes, methyl ethyl ketone, and benzene) were detected in two locations (TP-2, TP-25, TP-26, and SB-25) at concentrations exceeding Unrestricted Use SCOs; however, below Restricted Residential and Commercial Use SCOs. The low permeability of the lacustrine deposits that underlie the Site are likely to minimize the downward migration of these contaminants. These contaminants are not expected to impact groundwater quality or migrate substantially into the subsurface. This is supported by the lack of these analytes in the on-Site groundwater.

9.2.3 Groundwater

No contaminants of concern were identified within the groundwater at concentrations exceeding NYSDEC TOGS 1.1.1 AWQS, with the exception of the emerging contaminants PFOA and PFOS. Groundwater is not planned to be used for drinking in this area. Therefore, the PFOA and PFOS contamination does not pose a significant threat to public health or safety.

9.2.4 Soil Vapor

Although the NYSDOH has not established guidance for analytes within soil vapor, it appears that relatively low risk soil vapor VOC impact may be present on the south portion of the Site proximate SV-1. The presence of these VOCs within the soil vapor in this location could result in on-Site exposure to VOCs within indoor air; however, implementation of engineering controls (i.e. sub-slab depressurization system, VOC rated vapor barrier, etc.) should be sufficient to mitigate the potential for soil vapor intrusion within existing or future buildings located at the Site.

9.3 Evaluation of Potential Receptors

The Site is located in an area that is characterized primarily by commercial and industrial properties. Commercial properties are located to the north of the Site, Ganson Street and railroad tracks are located to the west, and the Buffalo River adjoins the Site to the east. No residences occur within 300-feet of the Site and the surrounding area is serviced by the municipal water supply system.

The Site is currently a commercial property with two buildings. The Site is currently improved with two structures; Building 1 is located on the south-central portion of the Site and Building 2 is located on the northern portion of the Site. Both buildings are unoccupied as of the date of this report. The remainder of the Site includes asphalt paved areas, gravel areas, and to a lesser extent, green space on the northern portion of the Site. Additionally, a concrete retaining wall follows the western Site boundary along the Buffalo River.

Under current conditions, potential human receptors include persons working or trespassing on the Site and persons involved in utility work at the Site.

Although Site redevelopment plans have not been finalized, it is anticipated that initial Site redevelopment will include a commercial mixed-use entertainment facility. There is the potential that multi-family residential may be pursued at the Site in the future. The redevelopment of the Site will be controlled through the implementation of engineering and institutional controls. These controls may include the following:

- Implementation of a Soil/Fill Management Plan
- Placement of a surface cover system across the Site
- Engineering controls to mitigate potential soil vapor intrusion pathways
- Implementation of erosion and dust control measures
- Maintenance of fencing around the Site or areas undergoing redevelopment
- Implementation of a storm water pollution prevention plan
- Adhering to NYSDEC/NYSDOH notification and reporting requirements
- Instituting health and safety procedures for construction activities and protection of the surrounding community

Under the intended future use scenario for the Site, the primary consideration in the determination of acceptable clean-up levels is the potential risk to human health posed by residual contaminants in the soil/fill, soil vapor, and groundwater.

With regard to residual chemical contaminants, no on-Site or off-Site human and/or environmental receptors have been identified in connection with the post-redevelopment period, assuming that the contaminated media has been controlled through the implementation of engineering and institutional controls.

9.4 Potential Exposure Pathways

9.4.1 Surface Soil/Fill

Under the current use scenario, persons living or working at the Site, or persons trespassing on the Site, could be exposed to SVOCs and metals, and to a lesser extent pesticides in the surface soil/fill via inhalation of airborne particles, incidental ingestion of, or dermal contact with the contaminated media.

Construction workers, site visitors, and persons living, working, and traveling through the Site could be exposed to SVOCs and metals, and to a lesser extent pesticides, in the surface soil/fill during excavation of the contaminated soil/fill in connection with Site remediation and redevelopment. Potential exposure routes for these receptors include inhalation of contaminated dust, incidental ingestion of, and/or dermal contact with the contaminated soil/fill. However, the use of appropriate personal protective equipment, dust suppression techniques, and personal/air monitoring; and the development and implementation of a Health and Safety Plan including a Community Air Monitoring Plan would minimize the risk of exposure during this stage of the project.

Methods to eliminate exposure pathways include removal of the impacted surface soil/fill, or placement of engineering controls, such as a cover system, over the areas of impact.

9.4.2 Subsurface Soil/Fill

The presence of elevated concentrations of SVOCs and metals, and to a lesser extent pesticides and VOCs in the subsurface soil/fill samples collected were not interpreted to represent a human or environmental exposure risk because no complete exposure pathways were identified under the current use scenario for the Site. This is a function of the subsurface disposition of the contamination, which effectively minimizes the potential for the incidental ingestion of, or dermal contact with the contaminated media. These factors

also reduce the potential for the emission of vapors and particulates that could pose an exposure risk via inhalation. This applies to persons living, working, and traveling through the area surrounding the Site, as well as persons visiting, working, or traveling on the Site.

Environmental receptors such as construction workers, site visitors, and persons living, working, and traveling through the Site could be exposed to VOCs, SVOCs, pesticides, and metals in the subsurface soil/fill during excavation of the contaminated soil/fill in connection with site remedial and redevelopment activities. Potential exposure routes for these receptors include inhalation of contaminated dust and incidental ingestion of and/or dermal contact with the contaminated soil/fill. However, the use of appropriate personal protective equipment, dust suppression techniques and personal/air monitoring, and the development of a Health and Safety Plan including a Community Air Monitoring Plan would minimize the risk of exposure during this stage of the project.

Methods to eliminate exposure pathways include removal of the impacted subsurface soil/fill, or placement of engineering controls, such as a cover system, over the areas of impact.

9.4.3 Groundwater

Groundwater in the vicinity of the Site is not utilized as a source of potable water. Therefore, no human exposure via ingestion of contaminated groundwater is likely to occur under the current use scenario for the Site. Environmental receptors such as construction workers or site visitors could be exposed to elevated PFOS and PFOA in groundwater during excavation activities in connection with Site redevelopment activities. Potential exposure routes for these receptors include incidental ingestion of and/or dermal contact with the contaminated groundwater. However, the use of appropriate personal protective equipment and the development of a Health and Safety Plan would minimize the risk of exposure during this stage of the project.

9.5 Vapor Intrusion

Based on the collective soil vapor results and the lack of significant VOC impact within soil/fill or groundwater at the Site, it appears that relatively low risk soil vapor VOC impact may be present on the south portion of the Site proximate SV-1. Environmental receptors may include occupants of the existing buildings or occupants of future buildings, through inhalation of VOC impacted indoor air originating from the subsurface soil vapor. In addition, environmental receptors to VOC impacted soil vapor may include construction workers during excavation activities in connection with Site redevelopment activities. Use of appropriate personal protective equipment and the development of a Health and Safety Plan would minimize the risk of exposure during this stage of the project.

Methods to eliminate exposure pathways include implementation of engineering controls (i.e. sub-slab depressurization system, VOC rated vapor barrier, etc.) to mitigate the potential for soil vapor intrusion within existing or future buildings located at the Site.

10.0 REMEDIAL ALTERNATIVES ANALYSIS

10.1 Remedial Goals and Objectives

The objective of the Remedial Alternatives Analysis (RAA) is to evaluate remedial alternatives and select remedial actions to be implemented at the Site for the intended re-use of the Site. As defined in NYSDEC DER-10 Section 4.0, remedial alternatives will be evaluated based on the following criteria:

a. *Overall Protection of Public Health and the Environment*: This criterion evaluates exposure and residual risks to human health and the environment during or subsequent to implementation of the alternative.
b. *Compliance with SCGs*: This criterion evaluates whether the remedial alternative will ultimately result in compliance with SCGs, to the extent practicable.
c. *Long-Term Effectiveness and Permanence*: This criterion evaluates if the remedy is effective in the long-term after implementation (e.g., potential rebound). In the event that residual impacts will remain as part of the alternative, the risks and adequacy/reliability of the controls will also be evaluated.
d. *Reduction of Toxicity, Mobility, or Volume with Treatment*: This criterion evaluates the reduction of contaminant toxicity, mobility, or volume as a result of the remedial alternative. In addition, the reversibility of the contaminant destruction or treatment is evaluated.
e. *Short-Term Effectives*: This criterion evaluates if the remedial alternative protects the community, workers, and the environment during implementation.
f. *Implement ability*: This criterion evaluates the remedial alternative based on its suitability, implement ability at the Site, and availability of services and materials that will be required.
g. *Cost Effectiveness*: This criterion evaluates the capital, operation, maintenance, and monitoring costs for the remedial alternative. The estimated costs are presented on a present worth basis.
h. *Community Acceptance*: This criterion evaluates the public's comments, concerns, and overall perception of the remedy. The Community Acceptance criterion incorporates public concerns into the evaluation of the remedial alternatives. Therefore, Community Acceptance of the remedy will be evaluated after the public comment period required by the BCP.
i. *Land Use*: This criterion evaluates the proposed remedial approach against the current, intended, and reasonably anticipated future use of the land and its surroundings.

10.2 Remedial Action Objectives

Remedial Action Objectives (RAOs) are medium-specific objectives for the protection of human health and the environment and are developed based upon contaminant-specific SCGs established by the NYSDEC and/or NYSDOH.

10.3 Development of Remedial Alternatives

This section develops the remedial alternatives being considered to address the contaminated media on the Site, supportive to re-use of the Site as a commercial mixed-use entertainment facility with the potential that multi-family residential may be pursued at the Site in the future. The remedial alternatives evaluated are summarized below.

<u>Alternative 1: No Further Action</u>

The No Further Action Alternative is included as a procedural requirement and as a baseline against which to evaluate other alternatives. Under this alternative, no further remedial or monitoring activities would

occur, and no environmental easement would be recorded. The underlying soil/fill at the Site would remain virtually as it is and change in use would not be limited, except by existing land use controls such as zoning.

Alternative 2: Track 4 Restricted Residential Use Cleanup

It is anticipated that this alternative will include the following:

1. Manage impacted soils disturbed during redevelopment of the Site.
2. Targeted excavation of approximately 500-tons of soil exhibiting gross field evidence of impact (i.e. staining, odors) located proximate SB-2 associated with NYSDEC Spill # 1810799.
3. Subsequent demolition of Building 2, targeted excavation of approximately 1,300-tons of soil exhibiting gross field evidence of impact (i.e. staining, odors) located proximate SB-25.
4. As appropriate, evaluate, monitor, and mitigate structures to remain as well as future structures at the Site for soil vapor intrusion per NYSDOH 2006 (and subsequent updates) Guidance for Evaluating Soil Vapor Intrusion.
5. Place a cover system to eliminate exposure of Site occupants to impacted soil/fill present at the Site.
6. The south portion of the Site immediately adjacent to the Buffalo River is currently improved by a concrete retaining wall which will be maintained during Site redevelopment. As such, disturbance of Buffalo River shoreline is not anticipated.
7. Proper closure/removal of oil-water separators not desired for future use or at the end of their useful life. Should subsurface soil or groundwater exhibiting evidence of impact be encountered during closure/removal of oil-water separators, such will be managed properly at that time.
8. Soil/fill disturbed during redevelopment of the Site, (i.e., excavation for foundations and utilities, Site grading, etc.) will be managed in accordance with NYSDEC DER-10.
9. As slag was encountered within select investigation locations, subsurface disturbance of the Site will comply with applicable DMM-5 requirements.
10. Should soil/fill be disturbed during Site redevelopment require export from the Site, it is anticipated that such will require landfill disposal. The cover system will be constructed per NYSDEC DER-10 Restricted Residential Use requirements. Although the final civil design for the Site has not been completed, it is expected that the cover system will include a two foot cover system or equivalent comprised of the following:
    a. Hardscaped concrete and asphalt impermeable surfaces such as building foundations, surface parking, and sidewalks.
    b. A clean cover system placed over landscaped areas.

The cover system will include placement of a demarcation layer between existing Site soils and the cover system. Standard institutional controls would also be implemented under this alternative. Specifically, a Site Management Plan (SMP) incorporating an Excavation Work Plan and Engineering and Institutional Control certification requirements would be developed and enforced through an environmental easement. The environmental easement would restrict the use of the Site to restricted-residential applications and preclude groundwater use without treatment.

The Environmental Easement would be filed with Erie County to run with the deed and include the following requirements:

- The property use will be restricted to restricted residential use, or less stringent uses
- The cover system will remain in place
- A Soil/Fill Management Plan will be implemented for all invasive activities at the Site

- The use of groundwater without treatment and New York State Department of Health approval will be prohibited
- Annual certification of institutional and engineering controls will be required

Alternative 3: Track 4 Commercial Use Cleanup

It is anticipated that this alternative will include the following:

1. Manage impacted soils disturbed during redevelopment of the Site.
2. Targeted excavation of approximately 500-tons of soil exhibiting gross field evidence of impact (i.e. staining, odors) located proximate SB-2 associated with NYSDEC Spill # 1810799.
3. Subsequent demolition of Building 2, targeted excavation of approximately 1,300-tons of soil exhibiting gross field evidence of impact (i.e. staining, odors) located proximate SB-25.
4. As appropriate, evaluate, monitor, and mitigate structures to remain as well as future structures at the Site for soil vapor intrusion per NYSDOH 2006 (and subsequent updates) Guidance for Evaluating Soil Vapor Intrusion.
5. Place a cover system to eliminate exposure of Site occupants to impacted soil/fill present at the Site.
6. The south portion of the Site immediately adjacent to the Buffalo River is currently improved by a concrete retaining wall which will be maintained during Site redevelopment. As such, disturbance of Buffalo River shoreline is not anticipated.
7. Proper closure/removal of oil-water separators not desired for future use or at the end of their useful life. Should subsurface soil or groundwater exhibiting evidence of impact be encountered during closure/removal of oil-water separators, such will be managed properly at that time.
8. Soil/fill disturbed during redevelopment of the Site, (i.e., excavation for foundations and utilities. Site grading, etc.) will be managed in accordance with NYSDEC DER-10.
9. As slag was encountered within select investigation locations, subsurface disturbance of the Site will comply with applicable DMM-5 / Management of Soils Contaminated with Technologically Enhanced Naturally Occurring Radioactive Materials (TENORM) requirements.
10. Should soil/fill be disturbed during Site redevelopment require export from the Site, it is anticipated that such will require landfill disposal. The cover system will be constructed per NYSDEC DER-10 Commercial Use requirements. Although the final civil design for the Site has not been completed, it is expected that the cover system will include a two foot cover system or equivalent comprised of the following:
    a. Hardscaped concrete and asphalt impermeable surfaces such as building foundations, surface parking, and sidewalks.
    b. A clean cover system placed over landscaped areas.

The cover system will include placement of a demarcation layer between existing Site soils and the cover system. Standard institutional controls would also be implemented under this alternative. Specifically, a SMP incorporating an Excavation Work Plan and Engineering and Institutional Control certification requirements would be developed and enforced through an environmental easement. The environmental easement would restrict the use of the Site to commercial use applications and preclude groundwater use without treatment.

The Environmental Easement would be filed with Erie County to run with the deed and include the following requirements:

- The property use will be restricted to commercial use, or less stringent uses
- The cover system will remain in place
- A Soil/Fill Management Plan will be implemented for all invasive activities at the Site
- The use of groundwater without treatment and New York State Department of Health approval will be prohibited
- Annual certification of institutional and engineering controls will be required

Alternative 4: Track 1 Unrestricted Use Cleanup

Under this alternative, the soil/fill impacted with contaminants at concentrations exceeding the Unrestricted Use SCOs at the Site would be excavated to an average depth across the Site of six ft bgs and disposed of at an appropriately permitted off-Site waste disposal facility. This alternative would preclude the need for engineering and institutional controls. It is estimated that approximately 67,800 cubic yards of soil/fill will require excavation and landfill disposal to successfully implement Alternative 4, and a similar volume of clean soil and structural fill would be necessary to backfill the Site.

10.4 Detailed Evaluation of Alternatives

10.4.1 Contaminated Fill Material and Groundwater Alternatives

Alternative 1: No Further Action

Overall Protection of Human Health and the Environment: This alternative will not be protective of human health or the environment. A number of surface and subsurface soil/fill samples contain contaminant concentrations exceeding SCGs established within the RI. Therefore, the potential exists for human exposure and impacts to the environment. This alternative would not meet the RAOs for the Site.

Compliance with SCGs: This alternative would not address impact present at the Site or mitigate exposure to contaminants in excess of SCOs, and would therefore not comply with SCGs established within the RI.

Long-Term Effectiveness and Permanence: This alternative provides no long-term maintenance measures and, as such, provides no reliable long-term control against exposure to impact present at the Site. All current and future risks would remain under this alternative.

Reduction of Toxicity, Mobility, or Volume of Contamination with Treatment: This alternative would not result in the reduction of contaminant toxicity, mobility, or volume and therefore, would not be in compliance with the RAOs.

Short-Term Effectiveness: There would be no increased short-term risks posed to the community, Site workers, or the environment associated with the No Action alternative.

Implement ability: No technical implement ability issues or action-specific administrative implement ability issues are associated with this alternative.

Cost-Effectiveness: There is no capital or operation, maintenance, and monitoring (OM&M) costs associated with this alternative.

Land Use: This alternative is not consistent with the reasonably anticipated future use of the Site.

Alternative 2: Track 4 Restricted Residential Use Cleanup

Overall Protection of Human Health and the Environment: This alternative is protective of human health and the environment. Targeted excavation of soil exhibiting gross field evidence of impact proximate SB-2 and SB-25 would be completed. Closure/removal of oil-water separators not desired for future use or at the end of their useful life will be completed. Should subsurface soil or groundwater exhibiting evidence of impact be encountered during closure/removal of oil-water separators, such will be managed properly at that time. Remaining contaminated surface and subsurface soil/fill material would be covered with clean material and soil vapor intrusion would be assessed and mitigated under site structures as appropriate. Should existing buildings be re-developed, the existing buildings will be evaluated for soil vapor intrusion and mitigated as necessary. To further protect human health, any future invasive work would be performed in accordance with a NYSDEC-approved SMP, and certification of the engineering and institutional controls would be performed on an annual basis.

Compliance with SCGs: This alternative would not be in compliance with SCGs, as not all contaminated soil/fill material would be removed from the Site. The removal of all soil/fill material exceeding the SCGs would not be practical due to the quantity of material and the associated cost for removal and disposal. The construction of a cover system would limit the potential for exposure to the soil/fill material. Imported cover material would need to meet backfill quality criteria per 6NYCRR Part 375. Site cover activities would necessitate preparation of and adherence to a community air monitoring plan for particulates in accordance with Appendix 1B of DER-10.

Long-Term Effectiveness and Permanence: The management of impacted soil/fill would be effective long-term to mitigate potential exposure during construction activities at the Site. The construction of a cover system and assessment/mitigation of soil vapor intrusion as appropriate would be effective in the long-term to limit the potential for exposure to Site impact. The efficacy of the cover system and soils management will be maintained and monitored through the SMP. Periodic Engineering and Institutional Control certification requirements would be required to assure the long-term cover integrity. The implementation of institutional controls via an Environmental Easement would aid in the long-term remedy of the Site.

Reduction of Toxicity, Mobility, or Volume of Contamination with Treatment: Placement of a clean cover system across the Site, targeted excavation of soil proximate SB-2 and SB-25, closure/removal of oil-water separators as well as management of subsurface impact if adjacent the oil-water separators if encountered would reduce the mobility of impact present within the soil/fill at the Site.

Short-Term Effectiveness: This alternative would increase short-term risks for the community and the workers during the soil/fill management, targeted excavation of soil proximate SB-2 and SB-25, oil-water separator closure/removal, constructing the cover system, and assessment/mitigation of soil vapor (i.e., through the disturbance of impacted fill). Community air monitoring, dust control, and erosion measures would be required during the remedial activities to minimize the short-term risks.

Implement ability: No significant technical or administrative implement ability issues are associated with this alternative.

Cost-Effectiveness: As the civil site design has not been established for the Site, the actual cost of this alternative is unknown; however, an estimated budget of between approximately $2,950,000 and $3,560,000 has been established to successfully implement Alternative 2. Table 7 details the estimated budget for Alternative 2.

Land Use: This alternative would be consistent with the anticipated future use of the Site.

Alternative 3: Track 4 Commercial Use Cleanup

Overall Protection of Human Health and the Environment: This alternative is protective of human health and the environment. Targeted excavation of soil exhibiting gross field evidence of impact proximate SB-2 and SB-25 would be completed. Closure/removal of oil-water separators not desired for future use or at the end of their useful life will be completed. Should subsurface soil or groundwater exhibiting evidence of impact be encountered during closure/removal of oil-water separators, such will be managed properly at that time. Remaining contaminated surface and subsurface soil/fill material would be covered with clean material and soil vapor intrusion would be assessed and mitigated under site structures as appropriate. Should existing buildings be re-developed, the existing buildings will be evaluated for soil vapor intrusion and mitigated as necessary. To further protect human health, any future invasive work would be performed in accordance with a NYSDEC-approved SMP, and certification of the engineering and institutional controls would be performed on an annual basis.

Compliance with SCGs: This alternative would not be in compliance with SCGs, as not all contaminated fill material would be removed from the Site. The removal of all soil/fill material exceeding the SCGs would not be practical due to the quantity of material and the associated cost for removal and disposal. The construction of a cover system would limit the potential for exposure to the soil/fill material. Imported cover material would need to meet backfill quality criteria per 6NYCRR Part 375. Site cover activities would necessitate preparation of and adherence to a community air monitoring plan for particulates in accordance with Appendix 1B of DER-10.

Long-Term Effectiveness and Permanence: The management of impacted soil/fill would be effective long-term to mitigate potential exposure during construction activities at the Site. The construction of a cover system and assessment/mitigation of soil vapor intrusion as appropriate would be effective in the long-term to limit the potential for exposure to Site impact. The efficacy of the cover system and soils management will be maintained and monitored through the SMP. Periodic Engineering and Institutional Control certification requirements would be required to assure the long-term cover integrity. The implementation of institutional controls via an Environmental Easement would aid in the long-term remedy of the Site.

Reduction of Toxicity, Mobility, or Volume of Contamination with Treatment: Placement of a clean cover system across the Site, targeted excavation of soil proximate SB-2 and SB-25, closure/removal of oil-water separators as well as management of subsurface impact if adjacent the oil-water separators if encountered would reduce the mobility of impact present within the soil/fill at the Site.

Short-Term Effectiveness: This alternative would increase short-term risks for the community and the workers during the soil/fill management, targeted excavation of soil proximate SB-2 and SB-25, oil-water separator closure/removal, constructing the cover system, and assessment/mitigation of soil vapor (i.e., through the disturbance of impacted fill). Community air monitoring, dust control, and erosion measures would be required during the remedial activities to minimize the short-term risks.

Implement ability: No significant technical or administrative implement ability issues are associated with this alternative.

Cost-Effectiveness: As the civil site design has not been established for the Site, the actual cost of this alternative is unknown; however, an estimated budget of between $2,880,000 and $3,520,000 has been established to successfully implement Alternative 3. Table 8 details the estimated budget for Alternative 3.

Land Use: This alternative would be consistent with the anticipated future use of the Site.

Alternative 4: Track 1 Unrestricted Use Cleanup

Overall Protection of Human Health and the Environment: Excavation and off-Site disposal to Unrestricted Use SCOs would be protective of human health and the environment under any reuse scenario. However, this alternative would permanently use and displace approximately 67,800 cubic yards of valuable landfill airspace, as well as remove a similar volume of clean material from an off-site borrow source.

Compliance with SCGs: This alternative would remove all contaminated soil/fill material to Unrestricted SCOs and would be in compliance with SCGs.

Long-Term Effectiveness and Permanence: This alternative would achieve removal of all impacted soil/fill material from the Site and would provide long-term effectiveness. Post-remedial monitoring and certifications would not be required.

Reduction of Toxicity, Mobility, or Volume of Contamination with Treatment: Through removal of all impacted soil/fill, this alternative would permanently and significantly reduce the toxicity, mobility, and volume of contamination within the Site. However, since this alternative transfers soil/fill material from one environment to another, an overall reduction of toxicity, mobility, and volume would not occur.

Short-Term Effectiveness: Short-term adverse impacts and risks to the community, workers, and environment during implementation of this alternative are possible due to the extensive disturbance of contaminated soil/fill. Site workers would be required to wear personal protective equipment (PPE) during excavation to prevent direct contact with soil/fill. Dust control methods would be required to limit the release of particulates during excavation activities and placement of the backfill soils. Physical hazards, primarily related to potential accidents from heavy truck traffic are also a concern, as the excavation work would require removal of a large number of truckloads of soil and import of a similar number of clean loads from the borrow source. Potential air quality and noise impacts to off-Site receptors located along trucking routes due to the large amount of material transport required to implement the remedy are also a concern.

Implement ability: Significant technical and administrative implement ability issues would be encountered in construction of this Unrestricted Use alternative. These include but are not limited to: the need for construction, maintenance, and operation of substantial dewatering facilities; the need to coordinate and secure disposal contracts with permitted off-Site landfills; and difficulty locating local borrow sources for such a large volume of backfill.

Cost-Effectiveness: The estimated budget to implement this alternative is in excess of $10,360,000. Table 9 details the estimated budget for Alternative 4.

Land Use: This alternative, although excessive for the anticipated future use of the Site, would not preclude the anticipated redevelopment of the Site.

10.5 Comparative Evaluation of Alternatives

Alternative 1: No Further Action

The No Further Action Alternative would not be protective of human health and the environment, would not be in compliance with SCGs, would not be an effective long-term remedy; would not reduce the toxicity, mobility, and volume of contamination; and would not be consistent with the reasonably anticipated future use of the Site. There would be no implement ability issues or cost associated with this alternative.

Alternative 2: Track 4 Restricted Residential Use Cleanup

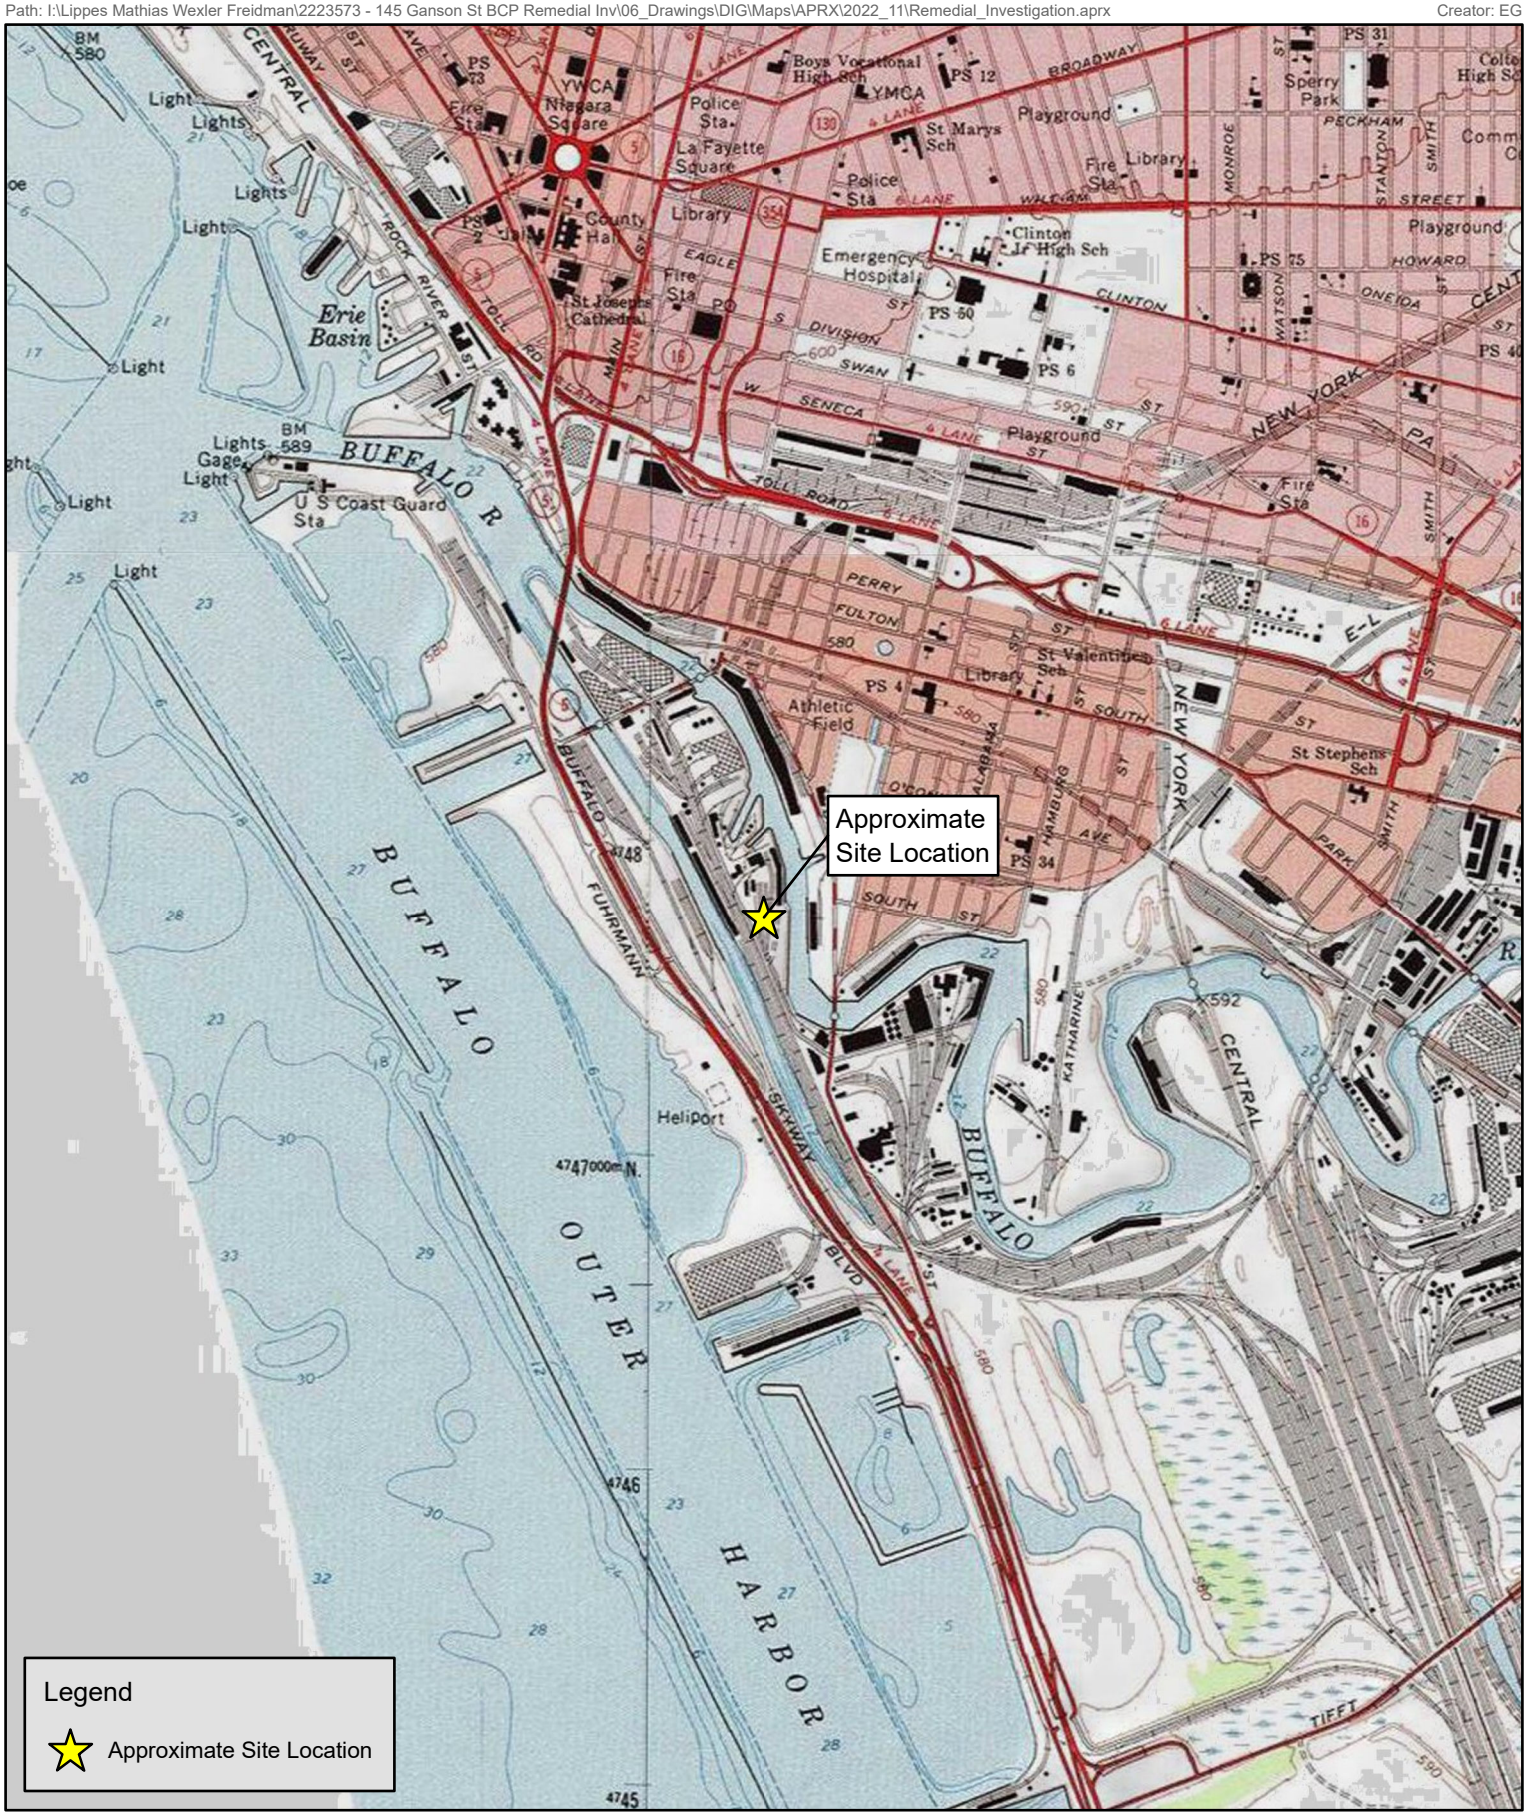
This alternative would be protective of human health and the environment; would be a long-term and permanent remedy, would effectively reduce or eliminate potential exposure routes through targeted excavation of soil proximate SB-2 and SB-25, closure/removal of oil-water separators as well as management of subsurface impact if adjacent the oil-water separators if encountered, the construction of a cover system, installation of a soil vapor membrane, placement of an environmental easement, implementation of a SMP, and annual certifications, and would be consistent with the anticipated future use of the Site. This alternative would create short-term adverse impacts and risks to the community, workers, and environment during implementation. While Alternative 2 will have a higher implementation cost than Alternative 3, Alternative 2 will enable the Site to be utilized for Restricted Residential use. Alternative 2 is significantly more cost effective than Alternative 4.

Alternative 3: Track 4 Commercial Use Cleanup

This alternative would be protective of human health and the environment; would be a long-term and permanent remedy, would effectively reduce or eliminate potential exposure routes through targeted excavation of soil proximate SB-2 and SB-25, closure/removal of oil-water separators as well as management of subsurface impact if adjacent the oil-water separators if encountered, the construction of a cover system, installation of a soil vapor membrane, placement of an environmental easement, implementation of a SMP, and annual certifications, and would be consistent with the anticipated future use of the Site. This alternative would create short-term adverse impacts and risks to the community, workers, and environment during implementation. While Alternative 3 will have a lower implementation cost than Alternative 2, Alternative 3 will restrict use of the Site to Commercial use. Alternative 3 is significantly more cost effective than Alternative 4.

Alternative 4: Track 1 Unrestricted Use Cleanup

This alternative would be protective of human health and the environment; would be a long-term and permanent remedy; and would reduce the toxicity, mobility, and volume of contaminants at the Site. This alternative would create short-term adverse impacts and risks to the community, workers, and environment during implementation. Based on the quantity of material that would be required to be removed from the Site, the amount of backfilled needed to be brought to the Site, and the associated costs, this alternative is impractical and not cost effective when compared to Alternative 2 and Alternative 3.



Remedial Alternative Selection

The recommended remedial action to address the contaminated fill material at the Site is Alternative 2: Track 4 Restricted Residential Use Cleanup. This alternative includes:

- Management of contaminated soil/fill during construction activities in accordance with DER-10 and DMM-5.
- Targeted excavation of soil exhibiting gross field evidence of impact proximate SB-2 and SB-25
- Closure/removal of oil-water separators not desired for future use or at the end of their useful life. Should subsurface soil or groundwater exhibiting evidence of impact be encountered during closure/removal of oil-water separators, such will be managed properly at that time.
- As appropriate, evaluate, monitor, and mitigate structures to remain as well as future structures at the Site for soil vapor intrusion per NYSDOH 2006 (and subsequent updates) Guidance for Evaluating Soil Vapor Intrusion.
- Placement of a two-foot clean material cover system across the Site.
- The implementation of a SMP.
- The placement of an environmental easement on the property.
- The completion of annual certification of the engineering and institutional controls.

NOTES:

mg/kg - milligrams per kilogram or parts per million (ppm)

ug/kg - micrograms per kilogram or parts per billion (ppb)

"<" - Indicates compound was not detected above the indicated laboratory method detection limit (MDL).

Underlined font indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(a) Unrestricted Use Soil Cleanup Objective (SCO)

Bold fonts indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Restricted Residential Use SCO

Gray highlight indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Commercial Use SCO

[1] hexavalent chromium/trivalent chromium

NL indicates Not Listed

J indicates an estimated value

J- indidcates an estimated value biased low

NA indicates Not Analyzed

U indicates value changed to non-detect by third party validator

NOTES:
mg/kg - milligrams per kilogram or parts per million (ppm)
ug/kg - micrograms per kilogram or parts per billion (ppb)
"<" - Indicates compound was not detected above the indicated laboratory method detection limit (MDL).
Underlined font indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(a) Unrestricted Use Soil Cleanup Objective (SCO)
Bold font indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Restricted Residential Use SCO
Gray highlight indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Commercial Use SCO
[1] hexavalent chromium/trivalent chromium
NL indicates Not Listed
J indicates an estimated value
J+ indicates an estimated value biased high
J- indicates an estimated value biased low
NA indicates Not Analyzed
U indicates value changed to non-detect by third party validator

NOTES:
mg/kg - milligrams per kilogram
ug/kg - micrograms per kilogram or parts per billion (ppb)
"<" - Indicates compound was not detected above the indicated laboratory method detection limit (MDL).
Underlined font indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(a) Unrestricted Use Soil Cleanup Objective (SCO)
Bold fonts indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Restricted Residential Use SCO
Gray highlight indicates that the compound was detected at a concentration above its respective NYCRR Part 375-6.8(b) Commercial Use SCOs
[1] hexavalent chromium/trivalent chromium
[2] total xylenes
Pesticides analyzed by USEPA Method 8081
NL indicates Not Listed
J indicates an estimated value
J- indicates an estimated value biased low
NA indicates Not Analyzed

Task 7: Reporting						
Remedial Action Workplan		1	each	$7,000	lump sum	$7,000
Final Engineering Report		1	each	$7,000	lump sum	$7,000
				Reporting Subtotal:		*$14,000*
Operation Maintenance & Monitoring (OM&M) Cost						
Annual Certification (30 Years)		30	each	$3,000	year	$90,000
				OM&M Subtotal:		*$90,000*
				Scenario 1 Estimated Total Project Cost [8]		**$2,944,281**
				Scenario 2 Estimated Total Project Cost [9]		**$3,577,683**

Notes/Assumptions:

[1] Unit rate includes costs for geotextile fabric, six inches of stone, and six inches of concrete pad (building slab). Excludes cost for foundation/footer components.

[2] Assumes that six inches of soil will require displacement, and that the constructed Building Concrete Slab final elevation can be six inches above the existing grade.

[3] Unit rate includes cost for geotextile fabric, eight inches of stone, 2.5 inches of asphalt binder, and 1.5 inches of asphalt top.

[4] Assumes six inches of soil will require displacement, and that the constructed asphalt parking final elevation can be six inches above the existing grade.

[5] Assumes that six inches of soil will require displacement, and that the constructed Landscaped final elevation can be 18 inches above the existing grade.

[6] Air monitoring and construction monitoring costs will be determined based on the clients project schedule, site conditions, actual personnel needs.

[7] As civil site design and geotechnical assessment of the Site is outstanding, it is unknown whether final site design will require export and landfill disposal of site soil, or whether site soil displaced during construction may be reused on-site.

[8] Scenario 1 assumes that final project/civil design will not require export of soil from the Site for landfill disposal.

[9] Scenario 2 assumes that final project/civil design will require export of a moderate volume of soil from the Site for landfill disposal. Should export of soil from the Site for landfill disposal be required, the volume of soil exported will be dependent on actual site conditions and final project/civil site design.

[10] Assumes that construction and air monitoring will be completed concurrent with Task 3. If completed independent of Task 3, additional cost will be incurred.

[11] Contingency of 20% calculated using total for Task 2 through Task 5.

This cost estimate excludes New York State sales tax.

The above remedial cost estimate is for project planning only. Final remedial cost will be determined based on actual site conditions and the final Site design which is outstanding. Soil volume displacement estimates and soil disposal costs assume that placement of cover systems will require displacement and export of an equal volume of material placed to construct the cover system. Actual soil displacement and export volumes will be dependent on final site design, whether soil can be reincorporated into the site, and the appropriate final site elevations.

ft^2 = square foot

yd^3 = cubic yard

TABLE 9
REMEDIAL COST ESTIMATE
ALTERNATIVE 4: UNRESTRICTED TRACK 1 CLEANUP
145 GANSON STREET, BUFFALO, NEW YORK

Item	Estimated Quantity	Unit Cost	Estimated Total
Task 1: Remedial Construction			
Soil Disposal [1]	115,185 ton	$55 ton	$6,335,175
General Fill [2]	51,706 yd^3	$27 yd^3	$1,396,062
Crushed Stone [3]	10,675 yd^3	$45 ton	$480,375
Top Soil [4]	2,820 ft^2	$48 ft^2	$135,360
Oil-Water Separator Removal/Closure	1 lump sup	$26,870 lump sum	$26,870
Air & Construction Monitoring [5]	6 months	$35,000 month	$210,000
		Remedial Construction Subtotal	*$8,583,842*
Task 2: Additional Capital Costs			
Civil Site Design			$50,000
Contingency (20%)			$1,716,768
		Additional Capitol Costs Subtotal	*$1,766,768*
Task 3: Reporting			
Remedial Action Workplan	1 each	$7,000 lump sum	$7,000
Final Engineering Report	1 each	$7,000 lump sum	$7,000
		Reporting Subtotal	*$14,000*
		Estimated Total Project Cost [8]	**$10,364,610**

Notes/Assumptions:

[1] Assumes excavation and landfill deposal of fill material across the entirety of the Site to an average depth of six feet below the ground surface.

[2] Assumes Site restoration will require import of five feet of general fill to be placed across the entirety of the Site with the exception of beneath the proposed building footprint.

[3] Assumes Site restoration will require placement of six feet of crushed stone beneath proposed building footprint, and eight inches of crushed stone beneath asphalt parking area and synthetic turf.

[4] Assumes Site restoration will require placement of one foot of topsoil across landscaped areas of the Site.

[5] Air monitoring and construction monitoring costs will be determined based on the clients project schedule, site conditions, actual personnel needs.

This cost estimate excludes New York State sales tax.

The above remedial cost estimate is for project planning only. Final remedial cost will be determined based on actual site conditions and the final Site design which is outstanding.

Cost estimate excludes costs for design and installation of shoring systems.

Attachments: Pages from DARFT_C915357_RIWP_December 2019_SampleSummary.pdf

Good Morning Adam,

Thank you for reaching out regarding the 145 Ganson Street site. To follow-up on our call from this past Friday, please see the responses below regarding the two items that were discussed:

- It would be acceptable to reduce the PFAS sample frequency to be consistent with the previous draft version of the RIWP. Attached along with this email is a table that details the PFAS sample frequency proposed in the previous version of the RIWP.
- Based on the existing environmental data, significant contamination has not been identified within or below the structure located at the site. Therefore, the Department would not incorporate building demolition into the scope of this work plan. The investigation of asbestos, asbestos contaminate material, and lead-based paint should follow applicable state, federal and local guidance and regulations. If a hazardous building material survey is conducted, please provide the results to the Department so we can document this information into our site file.

If you have any questions regarding these matters please feel free to give me a call at (716) 541-9657. Additionally, prior to the start of any field work please provide the Department with at least 7-days notice.

Thank you,
-Josh

ATTENTION: This email came from an external source. Do not open attachments or click on links from unknown senders or unexpected emails.

Josh:

I hope you are well. I just left you a voice message on your office phone.

As per my voice message, LaBella has been retained by SpotOn Legacy LLC to implement the Remedial Investigation Work Plan (RIWP) revised June 2020 prepared for the above Site. We intend on commencing RI site work September 6, 2022 and anticipate that the RI work will require approximately 2-weeks to complete in its entirety. In preparing for the RI work, I wanted to connect with you on a few items outlined below.

- Based on the contents of the Letter dated June 8, 2020 prepared by Benchmark Environmental Engineering & Science, PLLC (Benchmark) which accompanied the Remedial Investigation Work Plan (RIWP) revised June 2020, the NYSDEC provided the below comment (Comment #4) on May 7, 2020 related a prior version of the RIWP.

  The work plan states that "Select samples will be analyzed for and expanded list of parameters including TCL plus CP-51 List VOCs plus TICs, PCBs, pesticides, herbicides, 1,4-dioxane and PFAS." As shown on Table 3, only 12 of the 34 sub-surface sample locations will be analyzed for VOCs and 13 of the 34 sub-surface sample locations will be analyzed for metal/PCBs. Additional sub-surface samples should be analyzed for VOCs, metals, and PCBs.

  Although the NYSDEC's comment above generally requested additional sampling for VOCs, metals, and PCBs, per the contents of Benchmarks June 8, 2020 response letter and the related Table 3, it appears that Benchmark voluntarily elected to add an additional 5-6 subsurface soil samples for 1,4-dioxande and PFAs. As 1,4-dioxande and PFAs have not been identified as a contaminant of concern at this site at this time, and it appears that additional 1,4-dioxande and PFAs subsurface sampling were not requested by the NYSDEC, LaBella formally requests that the number subsurface soil samples submitted for 1,4-dioxande and PFAs be reduced to be consistent with the previous RIWP.

- As is detailed within Section 1.0 within the RIWP revised June 2020, redevelopment of the Site is anticipated to include demolition of the existing buildings located at the Site (Site Building 1 and Site Building 2). It should be noted that RIWP revised June 2020 did not include a scope of work to perform a pre-demolition hazardous building material survey. If a pre-demolition hazardous building material survey was desired to be completed as part of the RI, would such require submission of a revised RIWP delaying the September 6 start date, or could such be added to the RIWP scope of work as an addendum to the RIWP?

Thanks and have a great day!

Sincerely,

Adam Zebrowski

MS	--	Groundwater	1	1	1	1	1	1	1	1
MSD	--	Groundwater	1	1	1	1	1	1	1	1
Equipment Blank	--	Water								1
Field Blank	--	Water								1
Trip Blank	--	Water	1							
		TOTAL GROUNDWATER SAMPLES: (excluding QA/QC)	**8**	**4**	**4**	**4**	**4**	**4**	**4**	**4**

Notes:

1. Analyses will be performed via USEPA SW-846 methodology with equivalent Category B deliverables package.
2. Full List VOCs = TCL plus CP-51 List VOCs via Method 8260. Additional soil/fill samples will be collected for VOC analysis at investigation locations if elevated PID readings are detected in the field.
3. Tentatively Identified Compounds (TICs) will be analyzed per DER-10 for the RI samples.
4. Groundwater samples will be filtered in the laboratory for dissolved metals analysis.
5. 1,4-Dioxane will be analyzed in soil and groundwater samples; soil samples to be analyzed using EPA Method 8270 and groundwater samples to be analyzed using EPA Method 8270 SIM per NYSDEC guidelines.
6. PFAs (EPA Method 537) and 1,4-dioxane (EPA Method 8270 SIM) to be analyzed in two up-gradient wells and two down-gradient wells; wells to be determined based on groundwater isopotential map, in consultation with the Department.
7. GW field parameters including: pH, specific conductance, temperature, DO, ORP, and turbidity will be collected and recorded.

Acronyms:

VOCs = Volatile Organic Compounds
PFAS = Perfluoroalkyl Acids
SVOCs = Semi-Volatile Organic Compounds
TCL = Target Compound List
TICs = Tentatively Identified Compounds.
TAL = Target Analyte List
PCBs = Polychlorinated Biphenyls

---

Michael:

I hope you are well. Just wanted to touch base on the below email chain and provide an update on the AST removal.

- The AST removal was completed yesterday October 8. What appears to be limited stained soil was observed under the west portion of the AST subsequent removal (see attached photo). The staining does not appear to be significant; however, we plan to evaluate the nature of the staining as is further detailed below.
- Per the below September 9th email, we proposed completion of a series of test pits to evaluate the source of Anomaly 3. We currently have the test pit investigation to assess Anomaly 3 scheduled for next week Thursday October 17. I am recommending that we complete the following concurrent with the test pit work scheduled for October 17.
    - Collect one near surface soil sample for CP-51 VOCs and SVOCs from the stained area located adjacent the former AST fill port as previously agreed upon.
    - Advance one shallow test pit excavation to assess the vertical extent of the staining located beneath the west portion of the former AST and collect one soil sample for CP-51 VOCs and SVOCs.
    - Should the vertical extent of the staining be limited to proximate the ground surface, additional test pits will not be advanced.
    - Should the vertical extent of the staining extend beyond the ground surface, additional test pits will be advanced in attempt to evaluate the horizontal extent of the impact. At least one soil sample will be collected for CP-51 VOCs and SVOCs from each additional test pit.
    - The test pit investigation completed to assess both Anomaly 3 and the stained soil located beneath the AST will be limited to what can be completed within one 8-hour business day.
    - The test pit investigation will be completed utilizing methods consistent with the June 2020 Remedial Investigation Work Plan. The results of the test pit investigation will be summaries within the revised RI/AA Report.

Let me know if you have any questions.

Thanks,

Adam Zebrowski

Subject: RE: [Ext] RE: 20240702_C915357_145 Ganson_Geophysical Survey and AST Removal WP Approval Letter

Michael:

I hope you are well. As you know, LaBella Associates, D.P.C. (LaBella) submitted a draft Remedial Investigation and Remedial Alternatives Analysis Report (RI/AA Report) to the NYSDEC on November 30, 2023. Subsequently, the NYSDEC provided comments related to the draft RI/AA Report summarized within a Report Comments letter dated March 28, 2024. Comment 22 contained within the Report Comments letter reported that further investigation is necessary related to potential "sub-surface tanks" and "unknown piping" at the Site. As such, to further assesses the potential for orphaned underground storage tanks (USTs) at the Site, LaBella complete a geophysical survey at the Site, the results of which is summarized within the attached Geophysical Engineering Survey Report. Based on the contents of the Geophysical Engineering Survey Report and the collective environmental information gathered for the Site thus far, LaBella concludes the following.

1. The geophysical survey did not identify anomalies consistent with underground storage tanks (USTs). As such, further assessment of the Site for the potential for orphaned USTs does not appear warranted at this time.
2. The geophysical survey evaluated the nature of the "existing pipe of unknown nature" depicted within the attached Figure 2. As observed by LaBella during previous site visits, the "existing pipe of unknown nature" protrudes from the east exterior wall of Building 1, then travels vertically along the east interior wall of Building 1 entering the interior concrete floor. Based on the results of the geophysical survey, it appears that the "existing pipe of unknown nature" may be associated with an oil-water separator located beneath the northeast portion of Building 1 and may also be connected to an adjacent trench drain located within Building 1. It should be noted that soil borings SB-20W and SB-23 advanced adjacent to the location of the potential oil-water separator did not identity field evidence of impact (i.e., odors, staining, elevated PID readings) or contaminants exceeding Part 375 Residential or Commercial Soil Cleanup Objectives with the exception of Manganese, Arsenic, and Lead.
3. Three geophysical anomalies were identified on the exterior of the Site. Although the nature of

the anomalies cannot be confirmed, the anomalies appear to be consistent with disturbed soil and backfill. Further detail related to each geophysical anomaly is summarized below.

a. A geophysical anomaly was identified south of Building 1, hereinafter referred to as "Anomaly 1". The location of Anomaly 1 is consistent with the known location of historical UST's and a pump island detailed within the attached Figure 2 extracted from the Phase II ESA. As such, Anomaly 1 is likely related to the presence of backfill or disturbed soil associated with previous UST and pump island closure activity, and further exploratory excavation to confirm the source of Anomaly 1 does not appear warranted at this time. Subsurface conditions proximate Anomaly 1 have been assessed and detailed discussion related to the collective subsurface conditions proximate Anomaly 1 will be reserved for the revised RI/AA Report.
b. A geophysical anomaly was identified southeast of Building 2, hereinafter referred to as "Anomaly 2" . The location of Anomaly 2 is consistent with the known location of historical UST's detailed within the attached Figure 2 extracted from the Phase II ESA. As such, Anomaly 2 is likely related to the presence of backfill or disturbed soil associated with previous UST closure activity, and further exploratory excavation to confirm the source of Anomaly 2 does not appear warranted at this time. Subsurface conditions proximate Anomaly 2 have been assessed and detailed discussion related to the collective subsurface conditions proximate Anomaly 2 will be reserved for the revised RI/AA Report.
c. A geophysical anomaly was identified east of Building 2, hereinafter referred to as "Anomaly 3" . The location of Anomaly 3 is within the footprint of a historical pipe/tin shop detailed within the attached Figure 2 extracted from the Phase II ESA. Although review of historical Sanborn maps and aerial photography reveal the historical pipe/tin shop was present at the Site between at least 1925 and 1963, and there is the potential that Anomaly 3 may be the result of backfilling that occurred during demolition activities, the source of the Anomaly 3 is unknown. Furthermore, as records detailed within the Phase I ESA indicate that USTs were installed at the Site as late as 1980, Anomaly 3 cannot be ruled out as a potential UST grave. As such, we are proposing a limited test pit investigation (maximum four test pits to a maximum of eight feet below the ground surface) proximate the location of Anomaly 3 to evaluate the source of Anomaly 3 and evaluate the subsurface conditions in this location. The test pit investigation will be completed utilizing methods consistent with the June 2020 Remedial Investigation Work Plan. Collection of soil samples for laboratory analysis from the test pits is not anticipated; however, will be completed should field evidence of impact be encountered. We would like to complete the test pits within the next two weeks. The results of the test pit investigation will be summaries within the revised RI/AA Report. Please let me know if you have any questions or concerns.
d. It should be noted that the locations of historical UST, pump islands, etc. will be added to the Figures contained within the revised RI/AA Report.

Lastly, we are still working with the tenant towards closure of the 10,000-gallon diesel AST. It is our

understanding that the last of the fuel from the AST may be removed as early as today or tomorrow. Once the tenant confirms the closure date for the AST, we will immediately really such to the NYSDEC.

Please let us know if you have any questions related to the above or would like to discuss this further. Thank you and have a great day.

Sincerely,

Adam Zebrowski

Michael:

I hope you are well. The geophysical survey was completed Wednesday June 26th. The date for the AST closure has not been selected; however, based on the date the 30-day notice was submitted to Patrick Diez, the AST closure would occur sometime subsequent August 2.

Thanks,

Patrick:

I hope you are well. Per our previous conversations, attached is the 30-day notice to close/remove the 10,000-gallon AST located at 145 Ganson Street. As the Site is currently enrolled in the NYSDEC BCP, the attached workplan was shared with Michael Keller which was subsequently accepted by the NYSDEC. We do not have a dates selected for closure of the AST; however, will relay the schedule to you once the closure schedule is established. Feel free to reach out to me with any questions.

Thanks and have a great 4th of July.

Sincerely,

Adam Zebrowski

Re: 145 Ganson Street Site, Site No. C915357
Import Request Form and Documentation

Dear Mr. Keller:

During the site walk with the NYSDEC on May 30, 2024 at the above Site, you inquired as to the source and nature of one stone pile located along the west property boundary adjacent to Ganson Street. After evaluating with the Site tenant, Mr. Eric Bauer of GW Burnett, it appears that the stone (mixed #1 & #2 stone) was imported to the Site by GW Burnett in August 2020 from New Enterprise Stone & Lime without processing a formal import request with the NYSDEC. As such, for the NYSDEC's consideration, GW Burnett has retrieved the documentation related to the stone which is included with the accompanying formal import request. It should be noted that it is GW Burnett's intention to export the material to another yet to be determined location which will be processed through a supplement formal export request at the appropriate time.

Respectfully submitted,

LaBella Associates

Andy Janik, PG
Project Manager

NEW YORK STATE
DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Request to Import/Reuse Fill or Soil

This form is based on the information required by DER-10, Section 5.4(e) and 6NYCRR Part 360.13. Use of this form is not a substitute for reading the applicable regulations and Technical Guidance document.

SECTION 1 – SITE BACKGROUND

The allowable site use is: Commercial or Industrial Use

Have Ecological Resources been identified? no

Is this soil originating from the site? no

How many cubic yards of soil will be imported/reused? 0-50

If greater than 1000 cubic yards will be imported, enter volume to be imported:

SECTION 2 – MATERIAL OTHER THAN SOIL

Is the material to be imported gravel, rock or stone? yes

Does it contain less than 10%, by weight, material that passes a size 100 sieve? yes

Is this virgin material from a permitted mine or quarry? yes

Is this material recycled concrete or brick from a DEC registered processing facility? no

SECTION 3 - SAMPLING

Provide a brief description of the number and type of samples collected in the space below:

Approximately 39.51 ton of Mixed #1&#2 washed stone was delivered to the site for general use on 8/24/20. Being clean stone, this material was not sampled. A gradation sheet for this material has been provided.

Example Text: 5 discrete samples were collected and analyzed for VOCs. 2 composite samples were collected and analyzed for SVOCs, Inorganics & PCBs/Pesticides.

If the material meets requirements of DER-10 section 5.4(e)5 (other material), no chemical testing needed.

SECTION 3 CONT'D - SAMPLING

Provide a brief written summary of the sampling results or attach evaluation tables (compare to DER-10, Appendix 5):

Example Text: Arsenic was detected up to 17 ppm in 1 (of 5) samples; the allowable level is 16 ppm.

If Ecological Resources have been identified use the "If Ecological Resources are Present" column in Appendix 5.

SECTION 4 – SOURCE OF FILL

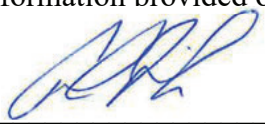
Name of person providing fill and relationship to the source:

New Enterprise Stone & Lime Co., Inc.

Location where fill was obtained:

500 Como Park Blvd.

Identification of any state or local approvals as a fill source:



New Enterprise Stone & Lime Co., Inc. - NYS Source Number 5-3R

If no approvals are available, provide a brief history of the use of the property that is the fill source:

Provide a list of supporting documentation included with this request:

Attached

The information provided on this form is accurate and complete.

Rochester, NY

Re: Parking Lot Abandoned Building
Ganson St.

Dear Chris

We certify the aggregates we supply on the subject project meet the New York State Department of Transportation Specification and Gradations as follows:

#1 & #2 Stone Mixed	
Sieve Size	Percent Passing
1 1/2"	100
1"	93-100
1/2"	27-58
1/4"	0-8

Our New York State Source Number at our Wehrle Drive location is 5-3R.

We trust this meets with your approval.

Sincerely,

Curt Resetarits
Vice President, Sales

1.0 INTRODUCTION

AFI Environmental was retained by Waste Management to conduct a Phase II Investigation of the property located at 191 Ganson Street in Buffalo, New York. This property was the subject of a Phase I Environmental Site Assessment (ESA), performed by AFI Environmental (AFI), which identified several potential areas of environmental concerns (AEC's). Further investigation was conducted to assess the potential environmental impacts that may have occurred or were related to the AEC's. Specifically, AFI identified several AEC's which include, but may not be limited to, the following:

- Numerous petroleum stained areas both in the garage areas and the staging/parking areas;
- Soils in and around the area of the former gasoline underground storage tank (UST) were never sampled and analyzed to confirm that no leakage had occurred from the UST.
- The fill materials utilized to backfill the dry docks north of the site, have been shown to contain elevated levels of VOCs, PCBs and metals. Additionally, groundwater in this area has also been shown to contain elevated levels of acetone, methylene chloride and metals.
- Potential impacts on the site from contaminants in the Buffalo River.
- Potential impacts on the site due to contaminants released on the adjacent properties.
- Potential discharges, including petroleum products and other vehicle operational and maintenance products, into the combined sanitary/storm sewers on site.
- Historical uses of the property for industrial purposes.
- Potential impact to the soils and stormwater sewers in and around the staging areas from leakage of leachate from trucks and roll-offs during routine operations.

The Phase II investigation of the project site was conducted to assess whether the identified AEC's have resulted in environmental impacts on the site and to characterize groundwater beneath the site. The field aspects of this investigation involved the drilling of test borings, the installation of monitoring wells and the collection of soil and groundwater samples. Soil and groundwater samples obtained during this field program were submitted for chemical analyses to enable an evaluation of site conditions relative to regulatory policy. AFI has prepared this *Phase II Investigation Report* to summarize the field investigation; present the results of the chemical analysis of soil and groundwater samples; evaluate the analytical data

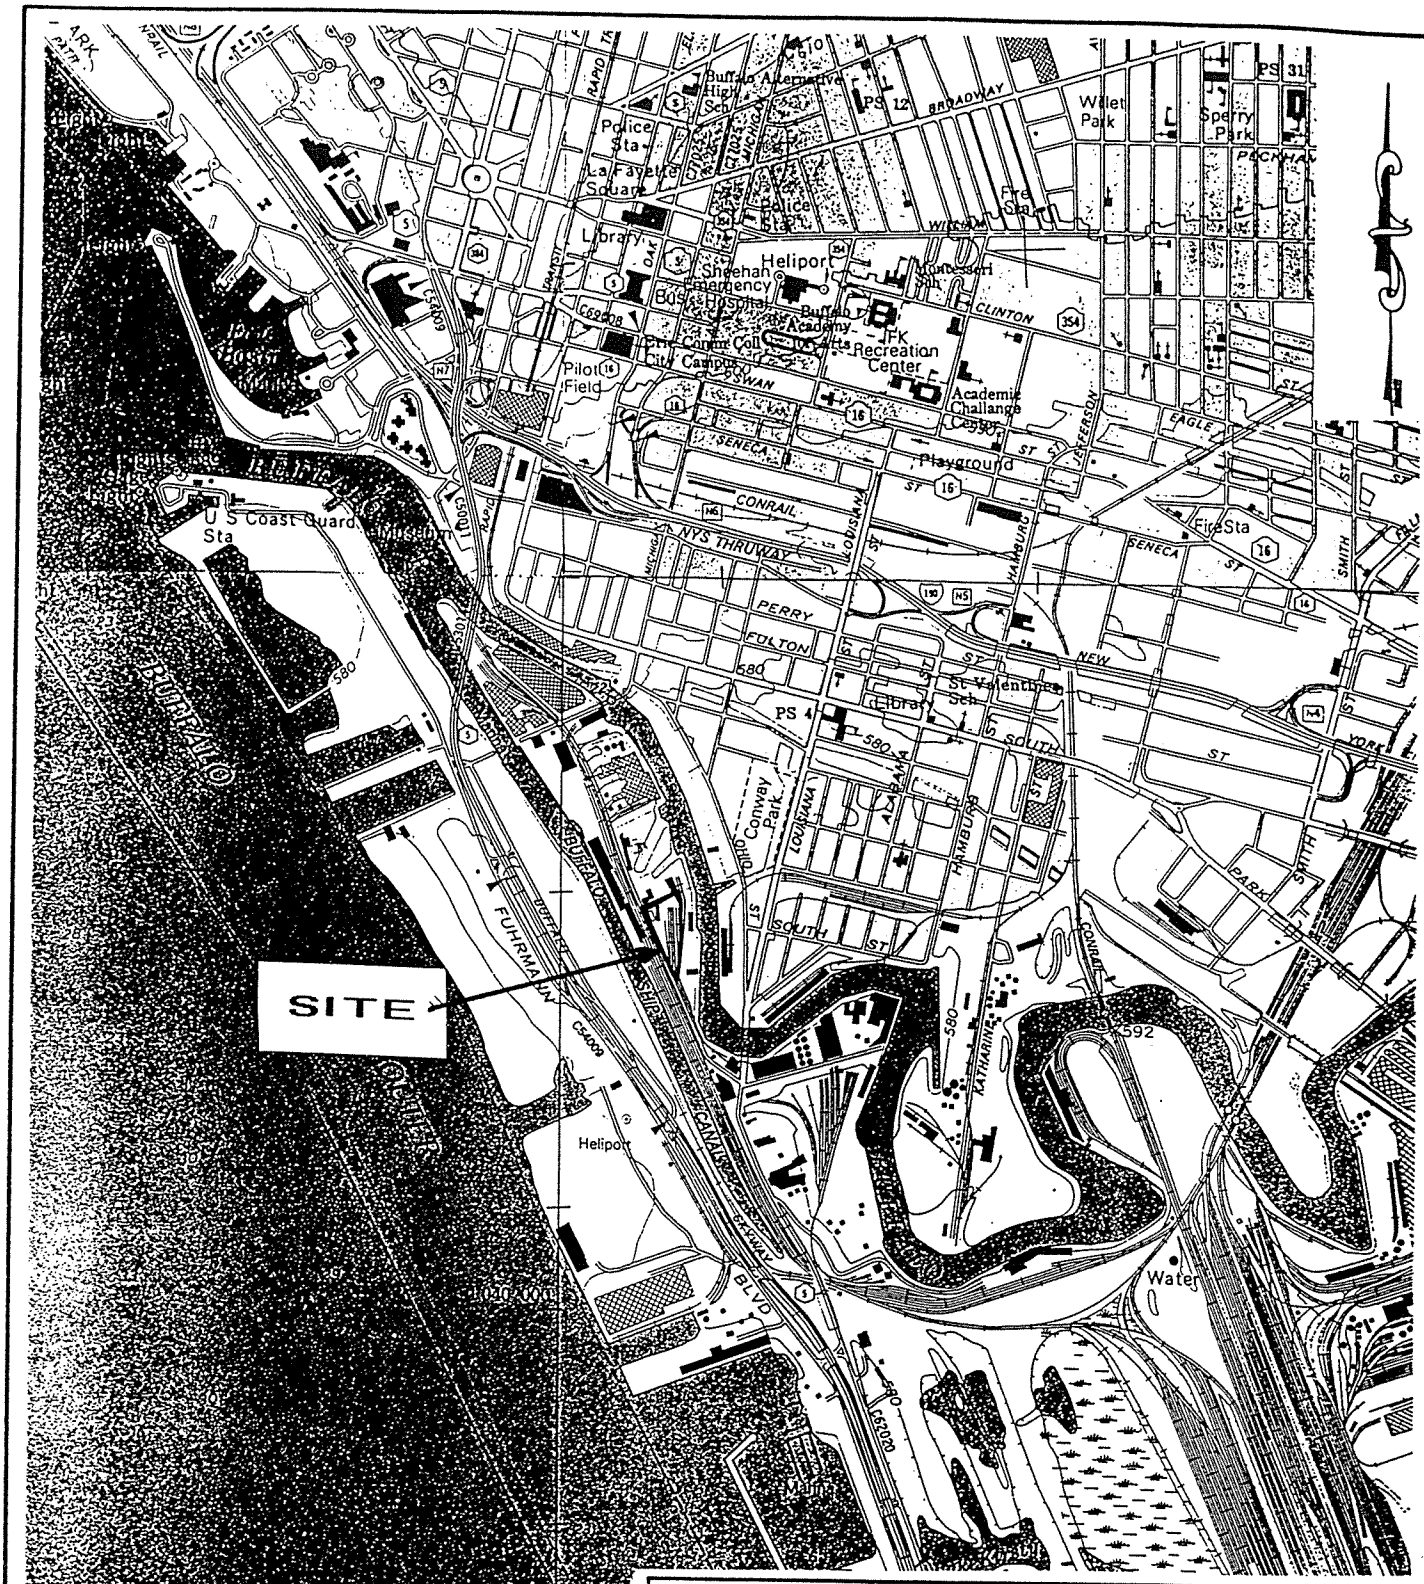
Printed on recycled paper
to help protect the environment.

with respect to applicable regulatory standards and/or guidance values; and to identify potential sources of contamination. No attempt was made to determine the actual boundaries of contamination, if found.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson Street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing Container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding properties are industrial in nature.



Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities include natural gas from National Fuel and electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York*, the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structures. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

It was determined that the site is not located within the one-hundred year or five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (< 10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and Materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- o There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- o The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).

- o One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - spent non-halogenated solvents (F003, F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o The site itself is a listed petroleum bulk storage facility. Additionally, two petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:

Printed on recycled paper
to help protect the environment.

- There are three LST (Leaking Storage Tanks) sites located within 0.5 mile radius of the subject property.

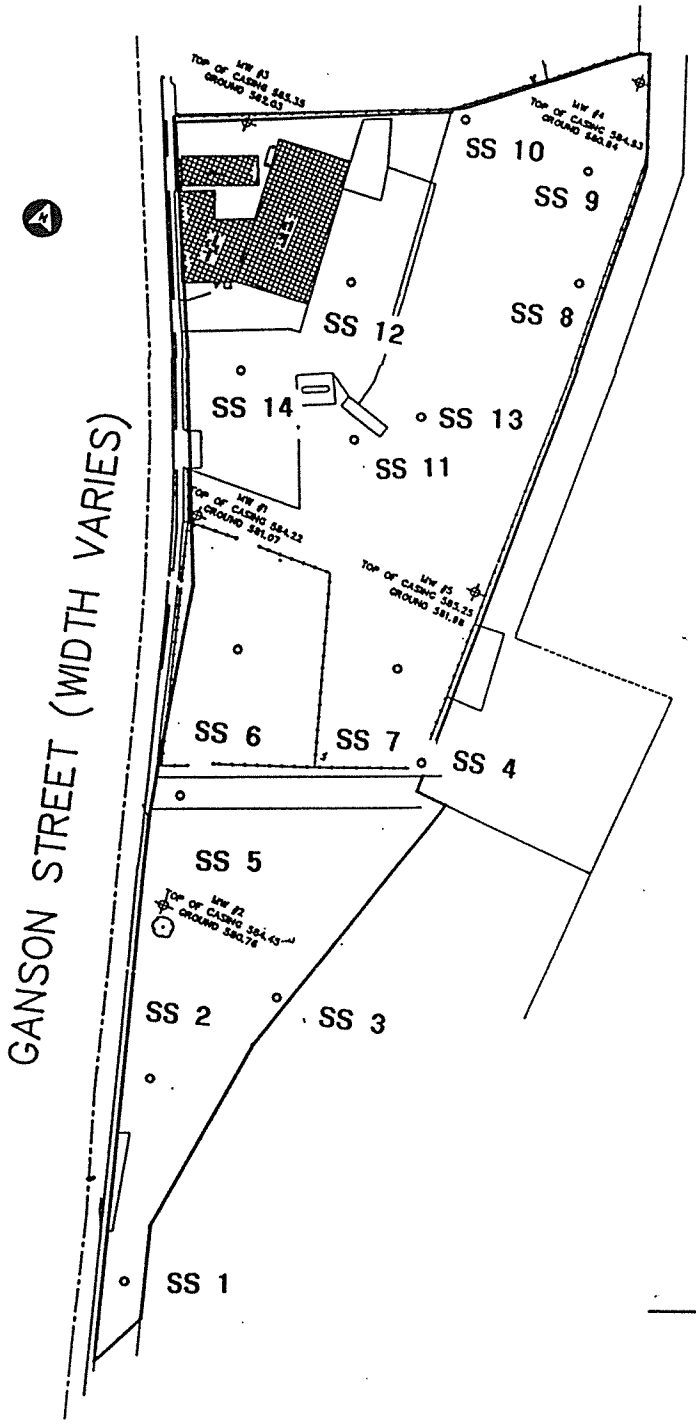
3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface of the subject property. The purpose of the investigation was to determine the presence or absence of contamination on the site.

4.0 METHODS OF INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental.

4.1 DRILLING, SOIL SAMPLING AND WELL INSTALLATION



Drilling, soil sampling and well installation procedures employed during this investigation as outlined in the following sections, are consistent with the collection of high quality data for hydrogeologic studies, and were selected based upon the collective experience of AFI Environmental staff and the drilling contractor, Advanced Drilling Investigations (ADI) of Niagara Falls, New York. All field work was directly supervised and documented by a qualified AFI Environmental Geologist, and the methods utilized were intended to minimize the potential for cross contamination. Five (5) groundwater monitoring wells and ten (10) soil borings were completed, and three (3) sediment samples collected at the site, the locations of which are depicted by Figure 3.

4.1.1 GROUNDWATER MONITORING WELLS

Overburden consisted of clayey silt, fine sand, silty sand, silty clay, and silty fine sand that was saturated at approximately 4-7 feet below ground surface. No odor or visual evidence of contamination was noted during drilling operations. The following paragraphs summarize the drilling, installation and design of these wells.

The installation of the wells was performed using a Mobile B-57 Drill Rig to advance 4 1/2" ID hollow-stem augers through unconsolidated geologic materials to a depth of approximately seventeen (17) feet. Soil samples were obtained continuously throughout the total depth of the boring using 2" OD split-barrel samplers in accordance with ASTM-D1586 procedures for Standard Penetration Test (SPT). Auger drilling proceeded with a steel plug inserted at the bottom of the auger stem to prevent material from entering the hollow stem and

to ensure accurate split-spoon sampling. The split-spoon sampler used was two (2) feet in length, unpainted, and equipped with a functional ball-check valve above the sample tube. The bottom of the sampling tube was equipped with a removable plastic "basket" retainer. The split-spoon was advanced through unconsolidated geologic materials at and below the bottom of the augers with a standard 140-pound hammer falling freely 30 inches. Blow counts were recorded for each six inches of penetration. Split-spoon samples were logged using the Unified Soil Classification System (USCS). Representative samples obtained from each split spoon were placed in appropriately labeled sample containers and immediately sealed with aluminum foil and screw on-cap. Field screening of soil samples obtained from split-spoons was conducted in accordance with the procedures outlined in Section 4.3.2.

Accurate test boring logs were prepared to document overburden stratigraphy and characteristics, depth to water, and all pertinent drilling observations.

Monitoring wells were installed immediately after auguring of the bore holes. The wells were constructed of two (2) inch diameter schedule 40, threaded, flush joint, PVC riser pipe and 10-slot PVC well screen. The screen was ten (10) feet in length, and fitted with threaded bottom plugs. The well screens were installed from approximately 7 feet below to 17 feet below the ground surface. A sand pack was gradually introduced to fill the annular space between the screen and the borehole wall. The sand pack extended from the bottom of the borehole to approximately one half (1/2) foot above the top of the screen. The sand pack consisted of washed, graded, silica sand with an average grain size and grain size distribution such that it was compatible with the screen slot size of 0.01 inches. A two (2) foot thick bentonite pellet seal was placed above the sand pack, and a cement/bentonite grout slurry extended from the top of the bentonite pellet seal to within one (1) foot of the surface. The well was completed by installing a six (6) inch steel casing with a stickup of approximately three (3) feet, with a locking cap. The grout was allowed to set up for 48 hours prior to well development. The well completion diagrams were prepared to document well construction details and material specifications and are included in Appendix A.

4.1.2 SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

4.1.3 SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as

Printed on recycled paper
to help protect the environment.

described in section 4.3.2. Excess material collected from the catch basins was returned to the bottom of the catch basins.

4.2 WELL DEVELOPMENT

The following well development procedures were employed 48 hours after completion of the groundwater monitoring wells. This allowed the cement/bentonite grout sufficient time to set-up and enabled the wells to equilibrate. Prior to evacuation procedures the water level within the wells was measured with an audible signal, water level indicator to facilitate calculation of the volume of water within the well. Water was then evacuated from the wells using a decontaminated, plastic bailer. Well development continued until a minimum turbidity was achieved. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

4.3 SAMPLE COLLECTION/SCREENING AND ANALYSIS

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analyses. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were placed in appropriately labeled sample containers for transport under proper chain of custody records to Lozier Laboratories for chemical analyses. The following sections outline sample collection and screening procedures, and identify the analytical methods employed to chemically characterize the groundwater and soil samples.

4.3.1 GROUNDWATER

After well development, the monitoring wells were allowed to equilibrate for 24 hours. The static water level within the monitoring wells were measured using an audible signal water level indicator. After calculating the volume of water contained within each well, purging was initiated. Purging was accomplished using decontaminated plastic bailers. Well purging continued until at least 3 well volumes were removed or a minimum of turbidity was obtained. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

Groundwater sampling was performed within 24 hours after purging. The monitoring wells were sampled using decontaminated plastic bailers. The samples were placed in laboratory precleaned and prelabeled containers, appropriate preservatives were added, and the samples were placed on ice in a cooler for transport to Lozier Laboratories under proper chain of custody records. Five (5) groundwater samples underwent testing in accordance with EPA SW-846 3rd edition.

Printed on recycled paper
to help protect the environment.

4.3.2 SOIL

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNu PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. A summary of field screening results for VOCs is contained in Table #1. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0 ppm to 0.7 ppm for the ten (10) soil and (3) three sediment samples.

Two (2) samples from the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-846 Method 8240 for VOCs, TCL Semi-VOCs by Method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s , and Cyanide by Method 9012.

4.4 DECONTAMINATION

All drilling equipment such as augers, bits and sampling equipment which came in contact with subsurface materials was decontaminated via steam cleaning before and after drilling activities at each borehole. Equipment decontamination consisted of the removal of all soils with a high pressure, low volume, steam and detergent wash. Split-spoon decontamination was performed between samples and consisted of a detergent wash and potable water rinse.

The AFI geologist supervising the field investigation ensured that all equipment was properly decontaminated prior to use at the site, between each borehole, and before leaving the site.

4.5 CONTAINMENT OF WASTES

Drill cuttings from the installation of the monitoring wells were transferred into labeled DOT-approved 55 gallon drums to await proper disposal. Similarly, all decontamination fluids and liquids withdrawn from the groundwater monitoring wells during development, purging and sampling activities were contained within labeled DOT-approved 55 gallon drums to await proper disposal by the client.

5.0 ANALYTICAL RESULTS

5.1 SOIL

Printed on recycled paper
to help protect the environment.

The Lozier laboratory report containing the analytical results for the soil samples analyzed via EPA SW-846 Method(s) 8240, 8270, 8080, 6010/7000 and 9012 are presented in Appendix C. This report also contains the case narrative, laboratory quality assurance/quality control (QA/QC) data, and chain of custody records. An initial review of the data indicated that the holding times for the 8080 Pesticides/PCBs and the TCL Semi-VOCs 8270 soil samples were exceeded prior to analysis. These samples were destroyed and resampled on December 6, 1994. All data reported within this report was analyzed within the required holding times, laboratory blanks were free of contamination, and all QC data were acceptable. These data are summarized and discussed in Section 6.0.

5.2 GROUNDWATER

The results of the chemical analysis of the five (5) groundwater samples collected from the onsite monitoring wells are presented in Appendix D. Additionally, the case narrative, laboratory QA/QC data and chain of custody records for these samples are presented therein. All groundwater samples were analyzed within the required holding times, surrogate standard recoveries were within acceptable limits (except for the low acid recoveries due to matrix interference on method 8270 for samples 1,3,4,5 and sample 6 for method 8080), and laboratory blanks were free of contamination. Section 6.0 contains a summary and evaluation of these groundwater data.

6.0 CONTAMINATION ASSESSMENT

An evaluation of the data resulting from the chemical analysis of soil and groundwater samples collected from the project site, including data from previous studies, was performed with respect to the following:

- o Type of Contamination
- o Potential Sources of Contamination
- o Compliance with Applicable Regulatory Guidelines

The succeeding subsections provide an assessment of the subsurface conditions at the project site, based upon available data, and provide the foundation for the recommendations concerning further investigation and/or remediation of the site discussed in Section 8.0.

6.1 SOIL

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum contstituents, possibly from fuel oil. Table 2 presents a summary of these results in a comparative format which includes the guidance values for each parameter as specified in the NYSDEC publication: *Spill Technology and Remediation Series (STARS) Memo #1 and/or*

Printed on recycled paper
to help protect the environment.

NYSDEC Soil Cleanup Objectives and Cleanup levels TAGM (January 24, 1994). As illustrated by Table #2, and discussed within the laboratory case narrative, all sediment samples were diluted, prior to analysis, due to the presence of a brown viscous petroleum hydrocarbon within the sample extract. The dilution of the sample raised the detection limits far above the NYSDEC guidance values by several orders of magnitude. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location # 9.

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10) and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data presented in Table #1. A further review of the same table reveals that not all samples locations exhibited VOC's. This may indicate that the impacts from the petroleum releases to the soil is limited. This assumption is supported by the lack of VOC's during the screening of the split spoon samples and the lack of any VOCs in the groundwater samples collected from the site. Therefore one could assume that not all areas of the site are contaminated with petroleum constituents.

6.2 GROUNDWATER

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. These data are summarized in Table #3. Based on a comparison with applicable guidance values established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the contaminants encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that contaminants originating from areas off-site are not migrating on-site via the groundwater flow system and that onsite contaminants are not migrating offsite via the groundwater system.

7.0 CONCLUSIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if contaminated soil was present and to characterize groundwater quality. In general, contaminated soil was encountered in varying degrees in the areas sampled. In this case we don't know that the values exceed the NYSDEC requirements because of the analytical method selected for analysis. It isa possible that some of the particular constituent levels could exceed the NYSDEC STARS limits, but this is unknown because TVLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCs, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location # 14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260,

Printed on recycled paper
to help protect the environment

normally of low mobility, was detected in all samples, with the highest value recorded in the staging/refueling area. PCBs may be resulting from fill brought on-site prior to Downing Container's existence, or it maybe a result of current activity and made mobil via the liquid petroleum fraction in the soils.

Groundwater samples collected from the five (5) overburden monitoring wells were clean. No contravention of NYSDEC guidance values for drinking water standards, in the areas monitored, has occurred. The placement of the monitoring wells near the periphery of the site indicates that no contaminants are entering or leaving the site via the groundwater flow system of the overburden, in the areas monitored.

8.0 RECOMMENDATIONS

Based upon the analytical data generated during the course of this investigation and a review of NYSDEC Petroleum-Contaminated Soil Guidance Policy, AFI Environmental recommends that a more extensive soil/sediment investigation be conducted. The objective of this program, would be to determine the concentrations, distribution (horizontal and vertical) and source of petroleum and PCB-1260 constituents in the soil. Once the boundaries, source and extent of the constituents, are defined, a corrective action program could be implemented. This would allow remediation of the site soils to within levels that are protective of human health and the environment.

However, recognizing that the site is located in a highly industrialized area and that the site is not currently leaching constituents into the groundwater or offsite via groundwater, a combination of testing, soil remediation, and paving with asphalt, concrete, or other impermeable semi-permanent material may warrant consideration.

The ultimate selection of the remedial method should be based upon further soil investigation and a number of parameters, including but not limited to effectiveness, potential impacts to human health and the environment, cost, and compatibility with the current commercial nature of the site. AFI also recommends that the NYSDEC be consulted regarding acceptable clean-up levels at the site, as well as the means by which these objectives will be achieved; once additional data has been collected and reviewed.

* NYSDEC Guidance Values from Jan 24, 1994 TAGM-Determination of Soil Cleanup Objectives and Cleanup Levels. HWR94-4046.

Allowable soil concentrations may be increased by a factor of 100 if the contamination is in the unsaturated zone above the water table. The value of 100 for correction is consistent with the logic used by EPA in its Dilution Attenuation Factor (DAF) approach for EP Toxicity and TCLP. (reference TAGM HWR94-4046).

Soil cleanup objectives are obtained by multiplying the allowable soil concentration by the correction factor.

Dear Mr. Minichiello:

Spill Number 9501488
191 Ganson Street
Buffalo
Erie County

We have reviewed the analytical results for the excavation samples from the above-referenced site. The results exceed our soil guidance values. However, since the results were low levels, we will not require any further work at this time. The site will have a status of "inactive".

Your cooperation is appreciated. If you have any questions, please call Mr. Robert Crossen of this office at (716) 851-7220.

Sincerely,

Salvatore A. Calandra

Re: Remedial Investigations WMNY - Ganson Street Property

Dear Mr. Crossen:

Enclosed with this letter is a copy of the Soil and Sediment Remediation Report that has been generated as part of an environmental assessment that was perform at the former Waste Management of New York, Inc. hauling division property on Ganson Street in Buffalo, N.Y. The enclosed remediation report represents the completion of remedial activities regarding the removal of petroleum impacted soils and sediments as part of a purchase and sale agreement, where WMNY was selling the Ganson Street property to another party.

The remedial reports documents the results of the remedial effort that was performed in accordance with the April 6, 1995, Remedial Action Plan Soil Investigation Report. All areas where chemical constituents had been identified were removed and identified as clean by AFI personnel. The results of composite samples taken from the excavation and removal areas show that the areas of interest were cleaned up to background levels or lower for all chemical constituents.

Please feel free to contact me at our Fairport, NY, location, indicated below, should you have any questions or comments regarding this matter. Thank-you.

Sincerely,

John A. Minichiello
Environmental Engineering Manager

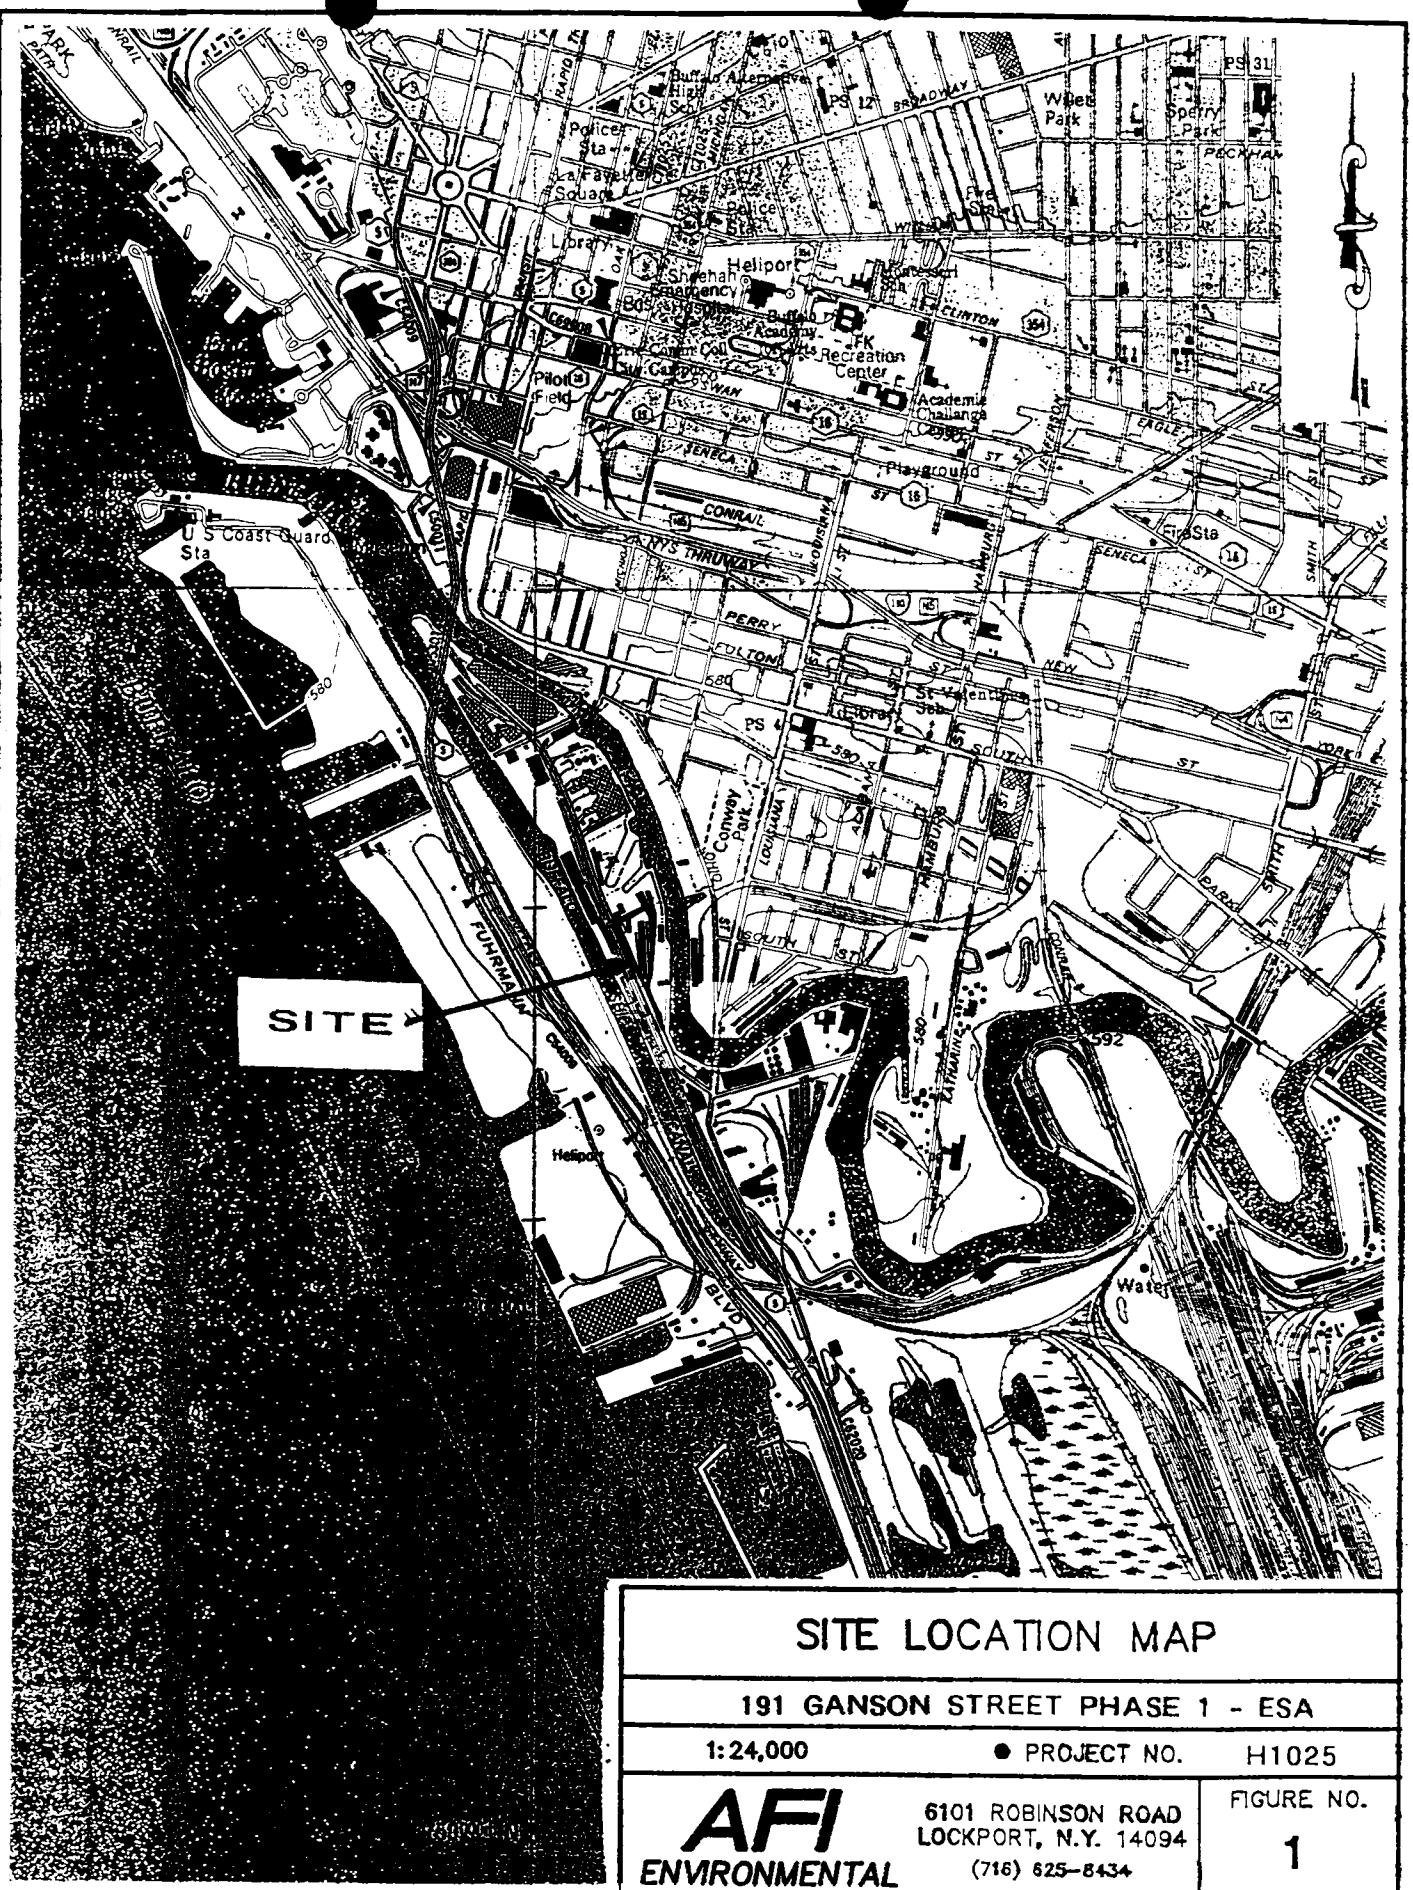
1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this *Soil and Sediment Remediation Report* on behalf of Waste Management of New York as documentation of their cleanup activities at 191 Ganson Street; prior to their move to 70 North Gates and subsequent occupation of the facilities by new tenants and/or owners. This report addresses petroleum impacted soil and sediment contamination encountered at the Downing Container Facility; located at 191 Ganson Street, Buffalo, New York (See figure #1 for site location map). This facility was the storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, rolloff and rental operations. This *Soil and Sediment Remediaton Report* (SSRR) was prepared as the final step of a three part process that included Environmental Assessment, Remedial Soil Investigation/ Delineation, and Cleanup.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York Inc. (WMNY), retained AFI Environmental to document the Soil and Sediment Remediation activities conducted by Environmental Products and Services, Inc. (EPS), Waste Managements's cleanup contractor at their 191 Ganson Street Facility.



This report has been developed for the private use of Waste Management of New York Inc., but all discussed activities were conducted under the observation of NYSDEC Spill Control personnel.

1.3 SCOPE OF WORK

The Soil and Sediment Remediation Activities conducted at 191 Ganson Street were consistent with the site specific recommendations made by AFI Environmental in their report entitled **"REMEDIAL ACTION PLAN SOIL INVESTIGATION REPORT"** dated April 6, 1995. These recommendations included:
(See figure #2 for site map).

- Removal of a 10' by 10' by 18" area of soil where chemical constituents were identified in the area of previously removed Underground Storage Tank (UST).

- Excavation of Study Area # 3, a 25' by 25' by 18" area located in the vicinity of the rolloff staging area where toluene contaminated soils were staged awaiting NYSDEC approval for disposal.

FIGURE NO. 1

- o Excavation of stained areas of the parking lot near the fuel islands and near the overnight truck parking area and other areas where visible.

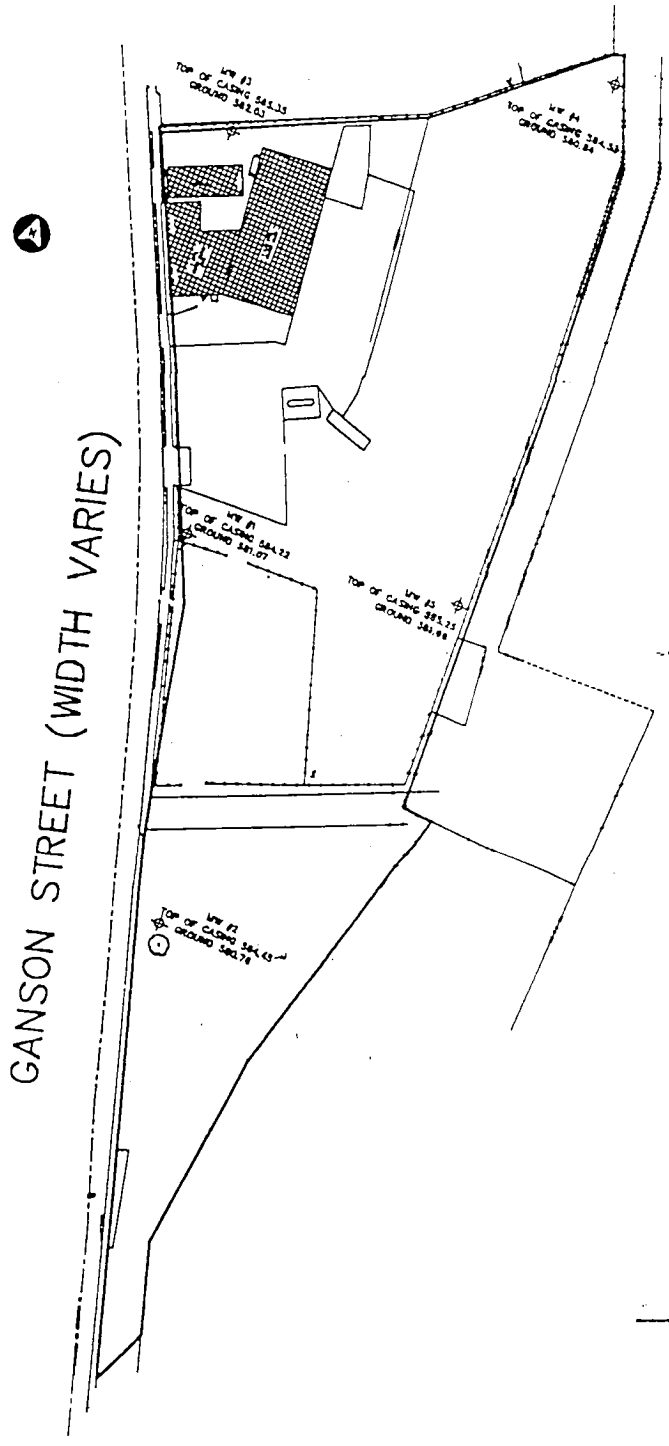
- o Sediment removal and cleaning of the Storm water drains.

- o Backfilling and compacting of all excavated areas with #2 crusher run stone.

- o Sampling excavated areas to demonstrate all contaminates have been removed.

- o Sampling excavated soils for waste characterization and disposal services purposes.

2.0 REMEDIAL PROGRAM



2.1 OVERVIEW

The Remedial program implemented at the facility located at 191 Ganson Street consisted of the excavation, removal and off-site disposal of impacted soils from the following areas (See Figure #3): the vicinity of the previously removed UST, near the North property line; from the roll-off staging area, near the East fence line, from the overnight truck parking area, near the gas fueling island; and contaminated sediment from the storm water sewer. This approach was utilized due to the relatively small volume of chemically impacted soil/sediment occurring at the site. All remedial activities were performed by Environmental Products and Services, Inc., a qualified and experienced remedial contractor, under the supervision of an AFI Environmental Engineer. In addition, New York State DEC Spill Control Personnel observed excavation and disposal activities. The procedures and equipment utilized were selected to minimize any potential for cross contamination, while maximizing the effectiveness of the clean-up effort. The following subsections provide a detailed description of the remedial measures implemented at the WMNY Site.

2.2 SOIL REMEDIATION

2.2.1 SOIL EXCAVATION NEAR THE PREVIOUSLY REMOVED UST (NORTH PROPERTY LINE)

Gravel and soil were excavated from a 10' by 10' by 18" area in the vicinity of the previously removed UST location (See figure #3). The excavation was accomplished using a backhoe and front end payloader operated by EPS personnel. The original excavation was enlarged by an additional 10' by 10' by 18" when petroleum stained material was identified by the AFI field engineer on the Eastern wall of the excavation. Similarly the depth of the excavation was increased to 30" when stained soils were evident on the floor of

the 18" excavated area. The excavation continued horizontally and vertically until no visual evidence of petroleum impacted soils were observed. All scrapings were placed in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.2 SOIL EXCAVATION IN THE VICINITY OF THE ROLL-OFF STAGING AREA (EAST PROPERTY LINE)

Gravel and soil were excavated from a 25' by 25' by 18" area in the vicinity of the roll-off staging area (See figure #3). The excavation was accomplished using a backhoe and front end payloader operated by EPS personnel. The original excavation was increased when petroleum stained material was identified by the AFI field engineer on the floor of the excavation. The depth of the excavation was increased to 36" when stained soils were evident on the floor of the 18" excavated area. Examination of the base of the excavation showed the fill material to be placed around a historic railroad hid with wooden cross ties and a wooden floor or foundation. The detenation of the wooden floor stained the soils black. This foundation layer continued in all directions for a thickness of approximately 4" - 5". To verify the contact of this fill layer one analytical sample was collected. The excavation continued to the depth and width where minimal evidence of impacted soils was observed. All scrapings were placed in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.3 SOIL EXCAVATION IN THE VICINITY OF THE OVERNIGHT TRUCK PARKING AREA AND FUEL ISLANDS.

Gravel soil in this section of the parking lot was excavated to a depth of 6" by a width of 15' and the length of 125' on both the East and West sides of the overnight truck parking area and fuel island. The excavation was completed by EPS Personnel using the front bucket of a payloader and scraping the surface to a depth of 6". A visual check of the excavation was made by AFI Personnel, after the excavation, to verify that all signs of staining had been removed. All scrapings were places in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.4 SPOT CLEAN UP

Gravel soil in the parking lot displaying visual signs of staining was excavated using a backhoe and placed into a poly-lined roll-off container. Excavation was to a depth and lateral extent large enough to remove all visual signs of staining.

The transport and disposal of stained soil excavated from these

areas was in accordance with section 2.4. The reclamation of the excavation was in accordance with section 2.5.

Following the completion of the measures outlined above, all areas excavated were filled with number 2 crusher run stone, compacted and leveled.

2.2.5 REMOVAL OF DRILLING CUTTINGS FROM PREVIOUSLY INSTALLED WELLS

Three (3) 55 gallon drums containing auger cuttings collected during the installation of the monitoring wells installed on site were disposed of by EPS Personnel. The drums were off-loaded into the Poly-lined roll-off containers, crushed flat, and disposed of with the soils.

2.3 SEDIMENT REMEDIATION

2.3.1 STORM SEWER SEDIMENT

Storm sewer remediation was conducted by the above contractor at later date. This was due to the need, by WMNY to obtain approval, from the Buffalo Sewer Authority, for disposal of the discharge material; prior to discharge into the Buffalo Sewer System. Sediment was removed from four (4) Storm Water inlets by using a vacuum line attached to a 3,000 gallon vacuum truck. Flushing of the sewer line was accomplished using a high pressure, water lancing system. The vacuum truck was operational during the sewer flushing procedure to capture the wash water. After flushing, the sediment accumulated at each inlet basin was manually removed and captured by the vacuum truck. All sediment and wash water was disposed of at the Buffalo Sewer Authority under proper disposal permits. AFI field engineers inspected the clearing activity after the activities had been completed.

2.4 TRANSPORT AND TREATMENT/DISPOSAL OF SOLID AND LIQUID WASTES

Impacted soil and sediment generated during the remedial program were placed in poly lined roll-off containers prior to removal from the site. This material was transported by Waste Management, a permitted hauler, to High Acres Landfill, a non-hazardous waste landfill, which was authorized to receive petroleum impacted soils. Analytical data from the chemical profiling of impacted soils collected prior to the remedial activities was utilized for waste characterization purposes. Analysis of soil collected during excavation is presented in Appendix A. This information was utilized by Waste Management personnel to complete Form 47-19-7, *Application for Treatment or Disposal of an Industrial Waste Stream* contained in Appendix B. All soils were disposed at the High Acres Landfill in Fairport, New York.

Wash water generated during the Storm Water cleaning, and collected by the vacuum truck, was transported under the appropriate permits to Buffalo Sewer Authority for treatment and/disposal. Sediment contained within the vacuum truck were removed and disposed at a permitted facility. Records documenting the transport and proper disposal of all solid and liquid waste were retained by Waste Management personnel and are not part of this report.

2.5 EXCAVATION RECLAMATION

2.5.1 BACKFILLING AND COMPACTION

EPS Personel backfilled each excavated area with clean #2 crusher run stone, then compacted the area by repeated running over the stone with a payloader. Final shaping was conducted by scraping the surface level. Photographs of the facility clean up activity are presented in Appendix C and Analytical Results are present in Appendix A.

2.5.2 BLACKTOPPING

Blacktop areas stained from the chronic overnight leaking of oil and grease from Packer and Roll-off Trucks, were scraped and resurfaced with a 1" top coat of fresh black top. (Photographs see Appendix C).

3.0 ANALYTICAL TESTING

3.1 SAMPLE LOCATIONS

Two (2) types of media were sampled during the course of the investigation performed by AFI Environmental, and can be classified as either soil or gravel. A total of five (5) soil samples were collected. The locations from which these samples were obtained are depicted on Figure 4.

3.2 SAMPLING TECHNIQUES

Two (2) sampling techniques were utilized to collect soil and sediment samples on June 29, 1995, and are described in the following subsections. All samples were collected by an AFI Environmental field engineer and were placed in precleaned laboratory sample bottles, which were labeled with the sample number, date and time of collection, sampler's initials, and the analyses requested.

3.2.1 GRAB SAMPLES

With the exception of the impacted soil samples collected from the location where UST was previously removed, the Roll-off staging area excavation sampling, and the sampling from the excavation near the truck staging area, the remaining soil samples were collected as grab samples. Grab samples were collected using a coated steel trowel that was decontaminated via a detergent wash and deionized water rinse prior to the collection of each sample. Grab soil samples were collected at the base of the excavation conducted in the vicinity of the Roll-off staging area.

3.2.2 HOMOGINIZED COMPOSITE SAMPLES

Homogenized composite samples were assembled to characterize background soil quality and to chemically profile the quality of soils remaining within the excavated areas once the visual evidence of impacted soils had been excavated. Homogenized Composite samples were also collected as a means of profiling soils for waste characterization purposes.

3.3 SAMPLING LOCATIONS

3.3.1 SAMPLING IN THE AREA OF THE PREVIOUSLY REMOVED UST

The sample from the site of the previously removed UST, identified as sample #3 was assembled from samples collected from five (5) points situated at the eastern, western, nothern, southern and bottom margin of the excavated area. Soil from each of these points was collected, placed on a poly sheet, and mixed to obtain a homogenous composite sample. (See figure #4 for sample location and Appendix A for results).

3.3.2 SAMPLING THE EXCAVATION IN THE VICINITY OF THE ROLL-OFF STAGING AREA

The sample from the site of the Roll-off staging area, sample #1 was assembled from samples collected from five (5) points situated at the eastern, western, southern, and north walls as well as the floor of the excavation. Soil from each of these points was collected, placed on poly sheet, and mixed to obtain a homogenous composite sample.

3.3.3 SAMPLING THE SUB-BASE OF THE ROLL-OFF STAGING AREA EXCAVATION

The sample from the Sub-base of the roll-off staging area excavation was collected as a grab sample from the area demonstrating signs of high carbon/wood content (black).

3.3.4 SAMPLING THE EXCAVATION IN THE VICINITY OF THE OVERNIGHT TRUCK PARKING AREA

The sample from the site of the overnight truck parking area, sample #5, was assembled from samples collected from five (5) points situated at the eastern, western, southern, and north walls as well as the floor of the excavation. Soil from each of these points was collected, placed on poly sheet, and mixed to obtain a homogenous composite sample.

3.3.5 WASTE CHARACTERIZATION

The sampling collected for Waste Characterization verification was collected as a composite sample; randomly selected from the spoils pile of excavated material, prior to being loaded into the roll-off container. The composite was made up from 3 distint sub-samples.

3.4 ANALYTICAL TESTING

All soil and sediment samples were transported under proper chain of custody records to Lozier Labs of Rochester immediately following collection on June 29, 1995. All samples underwent testing for waste characterization/PCBS, TCLP Stars 8021, and TCLP Stars 8270. These analytical methods were selected based upon results from earlier investigations at the project site.

The Lozier laboratory report containing the analytical results, QA/QC data, and chain of custody records is presented in Appendix A. These analytical results are discussed in the following paragraphs:

3.5 SOIL SAMPLES

3.5.1 ANALYTICAL RESULTS FROM THE FORMER SITE OF UST

Analytical results for Sample #3 collected as a composite sample from the sides and base of the former UST excavation are presented in Appendix A. As presented these results show that all values for PCB's except PCB-1260 are below quantifiable limits. PCB-1260 was detected at .27 mg/kg. Benzene and Tolumene were detected at 6.9 ug/1 and 1.6 ug/1 respectfully. All Poly Nuclear Aromatic Hydrocarbons identified in EPA method 8270 were below quantifiable limits.

3.5.2 ANALYTICAL RESULTS FROM THE ROLL-OFF STAGING AREA

Analytical results for Sample #1 collected as a composite sample from the sides and base of the roll-off staging area are presented in Appendix A. As presented these results show that all values for

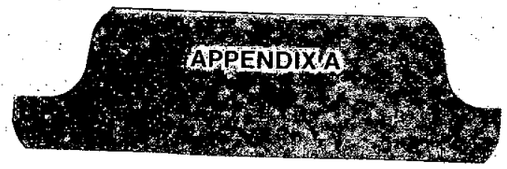
PCB's except PCB-1260 are below quantifiable limits. PCB-1260 was detected at .18 mg/kg. All Poly Nuclear Aromatic Hydrocarbon identified in EPA method 8270 and volatiles identified in EPA Method 8021 were below quantifiable limits.

3.5.3 ANALYTICAL RESULTS FROM BASE OF ROLL-OFF STAGING AREA

Analytical results for Sample #2 collected from the base of the roll-off staging area as a grab sample are presented in Appendix A. As presented these results show that all values for PCB's were below quantifiable limits. Benzene and Toluene were detected at 9.5 ug/1 and 5.0 ug/1 respectfully. All Poly Nuclear Aromatic Hydrocarbon identified in EPA method 8270 were below quantifiable limits.

3.5.4 ANALYTICAL RESULTS FROM TRUCK STAGING AREA

Analytical results for Sample #5 collected as a composite sample from the sides and base of the excavation near the truck staging area are presented in Appendix A. As presented these results show that all values for PCBare below quantifiable limits. All Poly Nuclear Aromatic Hydro Carbon identified in EPA method 8270 and all volatiles identified in 8021 TCLP Extraction were below quantifiable limits.



3.5.5 ANALYTICAL RESULTS FOR WASTE CHARACTERIZATION

As presented in Appendix A, results of Sample #4 analysis indicate that all parameters identified in EPA Method 8270, EPA Method 8021, and EPA Method 608 were below quantifiable limits, except for Toluene at 2.0 ug/L.

4.0 SUMMARY

The evaluation of analytical data resulting from the modified Phase II investigation and supplemental remedial investigation, at 191 Ganson Street, identified some chemical constituents within the soils and sediment from isolated areas across the site and within the storm water drainage system. The data from on site groundwater monitoring wells did not show any signs of chemical contamination of the Groundwater leaving or entering the site.

All areas where chemical constituents were identified in the soils were removed by EPS Personnel and verified as clean by visual inspection by AFI Personnel. The result of composite samples collected after clean-up activities show that all areas excavated were cleaned up to background levels or lower for all chemical constituents. A photographic record of clean-up procedure and site reclamation is presented in Appendix C.

APPENDIX B

GENERATOR'S WASTE PROFILE SHEET

PLEASE PRINT IN INK OR TYPE

Waste Profile Sheet Code: WMNA 326826

This form is to be used to comply with the requirements of a waste agreement.

INSTRUCTIONS FOR COMPLETING THIS FORM ARE ATTACHED

(Shaded Areas For Contractor Use Only)

Decision Expiration Date: 12 / 1 / 95

Contractor Sales Rep#: Hanalca

Service Agr. Renewal Date: / /

A. WASTE GENERATOR INFORMATION

1. Generator Name: Waste Management of N.Y. - Bfle
2. SIC Code:
3. Facility Address (site of waste generation): 421 Ganson St
4. Generator City, State/Province: Buffalo, NY
5. Zip/Postal Code: 14203
6. Generator USEPA/Federal ID #:
7. State/Province ID #:
8. Technical Contact: Tim Eich
9. Phone: (716) 852 - 6121

B. WASTE STREAM INFORMATION (See Instructions)

1. Name of Waste: Contaminated Soil
2. Process Generating Waste: excavation of truck parking area
3. Annual Amount/Units: 50 cubic yards
4. Type A ☒ (2) Type B ☐
5. Special Handling Instructions/Supplemental Information:
6. Incidental Waste Types and Amounts: None Known

C. TRANSPORTATION INFORMATION

1. Method of Shipment: ☐ Bulk Liquid ☐ Bulk Sludge ☒ Bulk Solid ☐ Drum/Box ☐ Other
2. Supplemental Shipping Information:
3. Is a DOT hazardous material? ☒ No ☐ Yes (If yes, complete 4, 5 & 6) 4. Hazard Class/ID #: NA
5. Reportable Quantity/Units (lb/kg): 0 6. Shipping Name: NA

D. TECHNICAL MANAGER DECISION (Check One) ☒ APPROVED ☐ DISAPPROVED ☐ Check if additional information is attached

If Disapproved, Explain:

If Approved, Continue.

1. Management Method(s): CO DISPOSAL OR USE AS DAILY COVER SOIL IN ACCORDANCE WITH PART 360 PERMIT.
2. Precautions, Conditions, or Limitations on Approval: ENSURE COPY OF SERVICE AGREEMENT IS ON FILE
3. For Type A Wastes, Laboratory Analysis of a Representative Sample Was: ☐ Waived ☒ Attached
   If waived, explain why:
4. List Non-WMI Facility that is Approved to Manage this Waste: Date:

Tech. Mgr. Signature: John A. Minchhand Name (Print): John A. Minchhand Date: 06/22/95

E. MANAGEMENT FACILITY INFORMATION / DECISION

1. Proposed Management Facility: High Acres Landfill
2. Proposed Intermediate Transfer Facility: 3. Transporter: Waste Management - Buffalo
4. Management Facility Gen. Mgr. Decision (Check One) ☒ APPROVED ☐ DISAPPROVED

If Disapproved, Explain:

If Approved, List Precautions, Conditions, or Limitations on Approval:

General Mgr. Signature: Joanne Ragusa Name (Print): Joanne Ragusa Date: 6/22/95

Turn Page and Complete Side 2 (If Type B Special Waste, only complete Part J of Side 2)

GENERATOR'S WASTE PROFILE SHEET

PLEASE PRINT IN INK OR TYPE

F. PHYSICAL CHARACTERISTICS OF WASTE (See instructions)

1. Color	2. Does the waste have a strong incidental odor?	3. Physical State @ 70 F/21 C.	4. Layers	5. Specific Gravity	6. Free Liquids:
Brown	☒ No ☐ Yes: If so describe:	☐ Solid ☐ Semi-Solid ☐ Liquid ☐ Powder ☐ Other:	☐ Multi-layered ☐ Bi-layered ☒ Single Phased	Range	☐ Yes ☒ No Volume: %

7. pH: ☐ ≤2 ☐ > 2-4 ☐ 4-7 ☐ [illegible] ☐ 7-10 ☐ 10- <12.5 ☐ ≥12.5 ☐ Range ☐ NA

8. Flash Point: ☐ None ☐ <140°F/60°C ☐ 140 - 199°F/60 - 93°C ☐ ≥200°F/93°C ☐ Closed Cup ☐ Open Cup

G. CHEMICAL COMPOSITION

	RANGE (MIN-MAX)
Soil Matrix	- %
	- %
	- %
	- %
	- %
	- %
	- %
	- %
	- %
Total	%

2. Does the waste contain any of the following? (provide concentration if known)

	NO	or	LESS THAN	or	ACTUAL
PCBs	☐		☒ < 50 ppm		____ ppm
Cyanides	☐		☐ < 30 ppm		____ ppm
Sulfides	☐		☐ < 500 ppm		____ ppm

Please note: Unless analytical results are attached, the chemical composition identification should include, at a minimum, Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Silver, Pesticides, Herbicides, and any other TCLP constituents that may be present in the waste. The total composition must be greater than or equal to 100%. (.0001% = 1 ppm or 1 mg/l)

3. Indicate method used to determine composition (if provided): ☒ TCLP ☐ Total ☐ Other: ____

H. SAMPLING SOURCE (e.g., Drum, Lagoon, Pit, Pond, Tank, Vat) ____

REPRESENTATIVE SAMPLE CERTIFICATION

1. Print Sampler's Name: [illegible] 2. Sample Date: ____

3. Sampler's Title: ____

4. Sampler's Employer if other than Generator: ____

The sampler's signature certifies that any sample submitted is representative of the waste described above pursuant to 40 CFR 261.20(c) or equivalent rules.

5. Sampler's Signature: ____

J. GENERATOR CERTIFICATION

By signing this profile sheet, the Generator certifies:

1. This waste is not a "Hazardous Waste" as defined by USEPA or Canadian Federal regulation and/or the state/province.
2. This waste does not contain regulated radioactive materials or regulated concentrations of PCB's (Polychlorinated Biphenyls).
3. The unshaded portions of this sheet and the attachments contain true and accurate descriptions of the waste material. All relevant information regarding known or suspected hazards in the possession of the Generator has been disclosed.
4. The Generator has read and understands the Contractor's Definition of Special Waste included in Part B.5. of the attached instructions form. All types and amounts of special wastes provided in incidental amounts have been identified in section B.6. of this form.
5. The analytical data presented herein or attached hereto were derived from testing a representative sample taken in accordance with 40 CFR 261.20(c) or equivalent rules.
6. If any changes occur in the character of the waste, the Generator shall notify the Contractor prior to providing the waste to the Contractor.

7. Signature X: [signature] 8. Title: [illegible]

9. Name (Type or Print) X: [illegible] 10. Date X: [illegible]

Dear John,

In accordance with the last paragraph in section IV item 44 of the High Acres Western Expansion Landfill operating permit, please find the attached disposal approval for:

Generator: WM - Buffalo

Waste Stream: cont. soil

Hauler: WM - Buffalo

One Time Disposal:____ Initial Profile: ✓ Recertification:____

Please feel free to contact me should you have any questions.

Sincerely,

Joanne Raguso

Re: Remedial Investigations WMNY - Ganson Street Property

SYNOPSIS ?

Dear Mr. Crossen:

Enclosed with this letter are copies of the Phase II and Phase III (Remedial Soil Investigation) reports that have been generated as part of an environmental assessment being perform at the Waste Management of New York, Inc. hauling division property on Ganson Street in Buffalo, N.Y.. Also included with the two reports is a copy of the work plan for the Phase III investigation. As I mentioned during our recent telephone conversation, the environmental assessment was performed as part of a purchase and sale agreement, where WMNY was selling the Ganson Street property to another party.

As the result of the various phases of the environmental assessment, it has been noted that there are localized areas of impacted soil as the result of fueling spills and leakage from parked vehicles. The impacted areas are nothave ed in the attached Phase III report. When you review the Phase II report you will note that five shallow overburden monitoring wells been installed and that groundwater samples have been obtained and analyzed with no impacts observed. In addition several soil and sediment samples were obtained and the results of these samples prompted the Phase III investigation.

The Phase III investigation contains recommendations for soil removal and additional testing to document that the impacted soils have been removed. We would like to be able to initiate the soil removal and additional testing as soon as possible, since the hauling division will be required to vacate the property to the new owner by mid June 1995.

Your timely review of these reports is very much appreciated. Please feel free to contact me, should you have any questions or comments regarding this matter. Thank-you.

Sincerely,

John A. Minichiello
Environmental Engineering Manager

RE: Remedial Soil Investigation Report
Downing Container Services - 191 Ganson St., Buffalo NY
AFI Project # h1025.1

Dear Mr. Minichiello:

Please find enclosed three copies of the Ganson Street Remedial Action Soil Investigation Report for the Downing Container Services 191 Ganson Street, Buffalo, New York location. One Copy is within scope of the original budget, and two copies provided for the New York State DEC are out-of-scope of the original budget.

If you need a change order for the two extra reports please let us know. Should you have any questions, please don't hesitate to call me at (716) 283-7645.

Sincerely,

AFI ENVIRONMENTAL

APPENDIX B

1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this **Remedial Soil Investigation Report (RSIP)** on behalf of Waste Management of New York, Inc. This RSIP is intended to address petroleum impacted soil and sediment encountered at the Downing Container Facility located at 191 Ganson Street, Buffalo, New York (Figure 1). This facility is the storage yard and repair shop for Waste Management of New York's Downing Container Division's garbage pickup, roll-off and rental operation. This RSIP was prepared to address potential areas of environmental concern (AECs) identified in a Phase I Investigation conducted on October 1994 and a modified Phase II Investigation completed on December 1994. The ESA and subsequent Phase II Investigation resulted in the detection of low level organic, inorganic, and PCB constituents in soil and sediment samples collected at the Ganson Street site. The areas of the site in which constituents were indicated include the following (refer to Figure 3).

The chemical analysis of sediment samples collected from within the storm sewer staging areas and gas islands indicated the presence of semi-volatile organic compounds (SVOC), PCBs metals at concentrations which exceed NYSDEC guidance levels. Potential sources which may have individually or collectively resulted in the impact to sediment and soil samples include petroleum based fluids utilized for facility operations; runoff of liquids from the garbage trucks or roll off boxes and fluid leakage from parked trucks and automobiles. Potential pathways of releases from these sources to the storm water control system include; runoff received by the storm sewer from the exterior roll off and truck staging area or fueling islands; and runoff from the parking area captured by the storm sewer.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York, Inc. retained AFI Environmental to further investigate the areal extent and composition of impact constituents in an attempt, to identify the cost to mitigate existing soil/sediment contamination at their 191 Ganson Street Waste management facility.

This RSIP has been developed for the private use of Waste Management, but in accordance with NYSDEC guidance memorandum.

This report presents the results of previous investigations conducted at the project site; outlines the scope of the Remedial Investigative program, identified the equipment and procedures utilized, and discusses results of the current investigation. This information is presented to identify the extent of soil and sediment contamination and support AFI's recommendation for

remediation/disposal options.

1.3 SCOPE OF WORK

The Remedial Soil Investigation conducted at the Ganson Street facility was consistent with the site specific sampling plan approved by Waste Management. The purpose of the investigation was to characterize the aerial extent of chemical constituents identified in the soils, through establishment of a grid sampling system in each of the three (3) areas identified as: areas of potential concern (AECs); during the previously completed Environmental Phase I and Modified Phase II Investigations. The scope of work consisted of the following remedial objectives:

- o Identification Of Three (3) General Investigative Areas.
- o Establishment Of A Sampling Grid At Each Area.
- o Selection And Implementation Of Soil Sample Collection Techniques.
- o Sample Composite Homogenization Techniques.
- o Development Of A Site Specific And Health And Safety Plan.
- o Data Presentation And Fecommendation For Delineation Of The Area Of Eexcavation And Disposal.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing Container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding

properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities included natural gas from National Fuel and Electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York,* the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structure. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

The Federal Emergency Management Association (FEMA) Flood Insurance rate Map (Panel No. 360230 0020) was consulted to determine the flooding potential of this site. It was determined that the site is not located within the one-hundred year of five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (<10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River.

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and Materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
- Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).
- One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:
  - spent non-halogenated solvents (F003,F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
- The site itself is a listed petroleum bulk storage facility. Additionally, two (2) petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:
- There are three (3) LST (Leaking Storage Tanks) sites located with 0.5 radius of the subject property.

3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York Inc.), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface and groundwater of the subject property. The purpose of the investigation was to determine the presence or absence of environmental impacts on the site.

3.3 MODIFIED PHASE II INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil

sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental. The final report was issued in December 1994.

3.3.1 MODIFIED PHASE II SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

3.3.2 MODIFIED PHASE II SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening. Excess material collected from the catch basins was returned to the bottom of the catch basins.

3.3.3 MODIFIED PHASE II SAMPLE COLLECTION/SCREENING AND ANALYSIS TECHNIQUES

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analysis. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were placed in appropriately labeled sample containers for transport under proper chain of custody record to Lozier Laboratories for chemical analysis.

3.3.4 MODIFIED PHASE II SOIL INVESTIGATION

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNU PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

Two (2) samples of the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-3846 Method 8240 for VOCs, TCL SEMI-VOCs by method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s, and Cyanide by Method 9012.

3.3.5 MODIFIED PHASE II SOIL RESULTS

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum constituents, possible from fuel oil. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location #9 (see figure #3).

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10 and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data.

3.3.6 MODIFIED PHASE II GROUNDWATER RESULTS

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. Based on a comparison with applicable guidance valued established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the constituents encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that constituents originating from areas off-site are not migrating on-site via the groundwater flow system and that the onsite constituents are not migrating offsite via the groundwater system.

3.4 MODIFIED PHASE II CONCLUSIONS/RECOMMENDATIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if

petroleum impacted soil was present and to characterize groundwater quality. In general, impacted soil was encountered in varying degrees in the areas sampled. Due to the analytical testing method utilized to SCAN soils no determination was made as to whether contamination encountered exceeded NYSDEC guidance values. It was suggested that some of the particular constituents levels could exceed the NYSDEC STARS limits, but this is unknown because TCLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCS, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location #14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260. A recommendation for TCLP analysis of the suspect area was made.

4.0 REMEDIAL INVESTIGATION

The Remedial Investigation conducted by AFI Environmental involved the collection and analysis of a series of (5) soil subsamples from three (3) distinct areas of concern; the area near the previously excavated UST (Area #1), the northeast roll off staging area (Area #2), and the area near the gas islands and storm sewer inlet (Area #3). These areas were identified during Modified Phase II Investigation as areas of environmental concern (AEC) and they are identified in figure #4. Each area of concern was divided into two (2) study areas and each study area was subjected to five (5) randomly selected subsamples. The subsampling and analysis program was developed to:

- Evaluate chemical constituent concentrations with respect to regulatory levels using TCLP Extraction Protocol; and
- Chemically profile potentially impacted soils and determine rough quantities requiring disposal at appropriately permitted facilities.

4.1 SAMPLING TECHNIQUES

Five (5) randomly selected soil subsamples were collected by an AFI Environmental field representative from each study area. Subsamples were collected at each location by scooping soil from the tailings of a hand auger at a depth of 6" to 18" using a precleaned stainless steel sampling spoon. The soil from each of the five (5) subsamples was placed in a precleaned stainless steel five (5) gallon bucket, and homogenized. A representative subsample was collected from the homogenized soil, in each study area, and placed in precleaned, sample bottle, labeled with the sample number, date and time of collection, sampler's initials, and the analysis requested and transported to Lozier Labs of Rochester under proper chain of custody.

4.1.1 Homogenized Composite Samples

Homogenized composite samples were assembled to characterize background soil quality and to chemically profile soils contained within the area showing previous evidence of contamination. Five (5) discrete subsamples were homogenized into one (1) sample for each study area.

4.1.2 STATISTICAL SAMPLING GRID

Each area of concern was divided into two (2) components or study areas. One component representing the "near-field" area, and a second component representing the "far-field" area. The "near-field" component consisted of a 25' x 25' area of soil "near" the Modified Phase II Investigation sample locations. The second component or "far-field" area consisted of a larger 125' x 125' square area concentric to the "near-field" study area. Both study areas were divided using a standard grid pattern into 36 intersections. The 36 intersection of the "near-field" were created by 5' spacing while the 36 intersections of the "far-field" area were created by 25'spacing. Five (5) locations were randomly selected for soil subsampling inside each study area and one (1) homogenized composite sample was assembled and sent for analysis from each area. This resulted in a total of five (5) samples being sent to Lozier Labs for analysis. (No "near-field" subsample was collected from the storm sewer and gas island area due to the concrete pad and pavement encountered).

4.2 ANALYTICAL TESTING

All soil samples were immediately transported under proper chain of custody records to Lozier Laboratories, Rochester, New York. All samples underwent testing for the Toxicity Characteristic Leaching Procedure (TCLP) STARS Volatiles 1311(8021), and semi-volatile organic compounds (SOCs) in accordance with EPA SW-846 Method 1-311/8220. These analytical methods were selected based upon discussion with Waste Management of New York personnel and due to the types of contaminants identified during earlier investigations at the project site.

5.0 RESULTS

Appendix A includes the results for all analysis conducted on the homogenized composite samples for the three (3) Study Areas. Only one (1) sample (PT #3) from the "near-field" study area #2 (see figure #4) exceeded the New york state Dec Guidance values as presented by the NYSDEC S.T.A.R.S. Program Analtical Test. This exceedance was noted for the chemical Parameter of Napthalene at location #2 where the presented value equalled 18ppb (adjusting for the 5 to 1 dilution equates to 90ppb). All other tested parometer were listed as non-detects or below the detection levels as presented by Lozier Labs.

6.0 CONCLUSIONS

According to SPOTS No. 14 (May 15, 1991) "...if the field analysis does not indicate any contamination at the site, and laboratory analysis of a minimum amount of sampling of soil/water taken from around the tank and piping confirms no contamination at the sample locations, it is reasonable to assume that no contamination exists at the site.

(However) If this minimum sampling does show contamination, then the Department (DEC) must be notified of this contamination and additional laboratory analysis must be conducted."

Since, AFI has already conducted additional analysis and the results from all but one area showed no contamination (utilizing a five (5) to one (1) dilution); it is reasonable to assume that chemical constituents in the soils are limited to the original sampling areas, and the one study area where chemical constituents exceeded guidance values.

AFI RECOMMENDATION

Generally a Phase III Site Assessment; or Exposure Assessment is conducted, at this point, to predict possible migration pathways or routes; and to identify areas where chemical constituents released into the soil may impact public health or the environment.

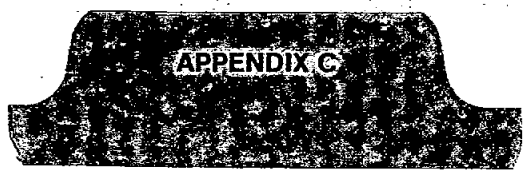
Phase III procedures generally include mapping the distribution of contamination, and predicting the pathways for exposure. The factors considered during a Phase III study include the volume released (which we do not know, but we assume to be minimal); the absorption capacity of the soil (which is medium to high); the relative ability of the soils to allow water movement (which is low); rate and direction of groundwater movement (known to be slight); and all processes that dilute concentration and limit the area of the contaminated zones (see Phase I and Modified Phase II reports).

However, the lack of detectable levels of the chemical constituents in the onsite monitoring wells; taken in consideration with the lack of detection of chemical constituents in all but one of the suspect areas during the most recent extended sampling; would allow one to conclude that TCLP contamination was limited to the one area demonstrating exceedance of the guidance values and the limited areas near each of the original modified Phase II sampling locations.

As such, AFI recommends that all areas where original contamination was documented during the modified Phase II Investigation be excavated and removed in a 10' x 10' area to a depth of 18". The excavation should be closed with #2 crusher run and/or fill and compacted for immediate use.

Study Area #3 should be excavated to 18", or refusal, throughout entire 25' x 25' boundary and replaced with clean and packed #2 crusher run stone. In addition, any stained areas near the truck parking, or roll off staging area, and fueling islands should be removed and filled with clean #2 crusher run stone and packed. All concrete should be steamed washed and the storm sewer inlets should be thoroughly cleaned with a VAC-Truck and steam washed after sediment removal.

All excavated soils should be staged in plastic lined roll off containers and a representative soil sample collected for waste profiling procedures.



AFI further recommends that additional composite samples be taken from the side walls and bottom of each excavated areas as well as from 1' to 2' beneath the excavation and run for TCLP. This data should be evaluated to assure that all chemical constituents have been removed.

A total of four (4) additional samples would be collected one (1) from each study area and one (1) from the staged soils to document the clean up.

AFI recommends removal of all visually stained soils in each of the study areas to a depth of 18".

All removed and/or contaminated soils should be properly disposed of at a legally permitted facility.

AFI also recommends that a copy of the final closure report be submitted to the DEC as a token of good faith and request there comments once the final samples have been tested and the site is documented to be clean so that they have record of the cleanup.

RE: Remedial Soil Investigation **FINAL/REVISED DRAFT PLAN**
Downing Container Services- 191 Ganson St., Buffalo, NY
AFI Project No. H1025.1

Dear Mr. Minichiello:

Enclosed, please find the revised draft copy of the Ganson Street Remedial Action Plan. This is in response to your review and mark ups. We are ready to begin as soon as the snow is off the study area or sooner if you desire to have the snow scraped.

Please advise.

Should you have any questions or comments please don't hesitate to call me at the Lockport office.

Sincerely,

AFI ENVIRONMENTAL,

William L. Heizenrater

1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this *Remedial Action Plan* (RAP) on behalf of Waste Management of New York, Inc. This RAP is intended to address petroleum impacted soil and sediment encountered at the Downing Container Facility located at 191 Ganson Street, Buffalo, New York (Figure 1). This facility is the storage yard and repair shop for Waste Management of New York's Downing Container Division's garbage pickup , roll-off and rental operation. This RAP was prepared to address potential areas of environmental concern (AECs) identified in a Phase I Investigation conducted on October 1994 and a modified Phase II Investigation completed on December 1994. The ESA and subsequent Phase II Investigation resulted in the detection of low level organic, inorganic, and PCB constituents in soil and sediment samples collected at the Ganson Street site. The areas of the site in which constituents were indicated include the following (refer to Figure 2).

The chemical analysis of sediment samples collected from within the storm sewer staging areas and gas islands indicated the presence of semi-volatile organic compounds (SVOC), PCBs metals at concentrations which may exceed NYSDEC guidance levels. Potential sources which may have individually or collectively resulted in the impact to sediment and soil samples include petroleum based fluids utilized for facility operations; runoff of liquids from the garbage trucks or roll off boxes and fluid leakage from parked trucks and automobiles. Potential pathways of releases from these sources to the storm water control system include; runoff received by the storm sewer from the exterior rolloff and truck staging area or fueling islands; and runoff from the parking area captured by the storm sewer.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York, Inc. has retained AFI Environmental to investigate further the areal extent and composition of impacts in an attempt to identify the cost to mitigate existing soil/sediment contamination at their 191 Ganson Street Waste Management facility. This RAP has been developed for the private use of Waste Management, but in accordance with NYSDEC guidance memorandum. This plan presents the results of previous investigations at the project site; and outlines the scope of the proposed remedial investigative program, and the equipment and procedures to be utilized to evaluate the areal extent of soil and sedimentary contamination to determine the cost of remediation/disposal.

1.3 SCOPE OF WORK

The remedial program proposed for implementation at the Ganson Street facility consists development of a site specific sampling plan in an attempt to characterize the aerial extent of chemical constituents identified in the soils, through establishment of a grid sampling system in

each of the three (3) areas identified as: areas of potential concern (AECs); during the recently completed Environmental Phase I and Modified Phase 2 Investigations. The scope of work required to accomplish these remedial objectives includes the following:

- o Identify three (3) general Investigative areas.
- o Establish a Sampling Grid at each area.
- o Identify Soil Sample Collection techniques.
- o Identify Sample Composite Homogenization techniques.
- o Provide a site specific and Health and Safety Plan.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson Street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities included natural gas from National Fuel and electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York*, the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings,or other impervious structure. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

The Federal Emergency Management Association (FEMA) Flood Insurance rate Map (Panel No. 360230 0020) was consulted to determine the flooding potential of this site. It was determined that the site is not located within the one-hundred year or five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (< 10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River.

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- o There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- o The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).

- One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - spent non-halogenated solvents (F003,F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- The site itself is a listed petroleum bulk storage facility. Additionally, two petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:

- There are three LST (Leaking Storage Tanks) sites located within 0.5 radius of the subject property.

3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York Inc.), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface and groundwater of the subject property. The purpose of the investigation was to determine the presence or absence of environmental impacts on the site.

3.3 MODIFIED PHASE II INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental. The final report was issued in December 1994.

3.3.1 SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

3.3.2 SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening. Excess material collected from the catch basins was returned to the bottom of the catch basins.

3.3.3 SAMPLE COLLECTION/SCREENING AND ANALYSIS

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analysis. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were place in appropriately labeled sample containers for transport under proper chain of custody record to Lozier Laboratories for chemical analysis.

3.3.4 SOIL

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNu PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

Two (2) samples of the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-846 Method 8240 for VOCs, TCL Semi-VOCs by method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s, and Cyanide by Method 9012.

3.3.5 SOIL RESULTS

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum constituents, possibly from fuel oil. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location #9.

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10) and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data.

3.3.6 GROUNDWATER

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. Based on a comparison with applicable guidance valued established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the constituents encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that constituents originating from areas off-site are not migrating on-site via the groundwater flow system and that the onsite constituents are not migrating offsite via the groundwater system.

3.4 PHASE II CONCLUSIONS/RECOMMENDATIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if petroleum impacted soil was present and to characterize groundwater quality. In general, impacted soil was encountered in varying degrees in the areas sampled. In this case we don't know that the values exceed the NYSDEC requirements because of the analytical method selected for analysis. It is possible that some of the particular constituents levels could exceed the NYSDEC STARS limits, but this is unknown because TCLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCs, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location #14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260,

4.0 REMEDIAL INVESTIGATION

The investigation proposal by AFI Environmental involves the collection and analysis of a series of soil and sediment samples from three distinct areas; the storm sewer, the UST area, and northeast rolloff staging area. This sampling and analysis program was developed to:

- o To evaluate constituent concentrations with respect to regulatory levels using TCLP Extraction Protocol; and

- o Chemically profile potentially impacted soils and determine rough quantities for disposal at an appropriately permitted facility.

4.1 SAMPLING TECHNIQUES

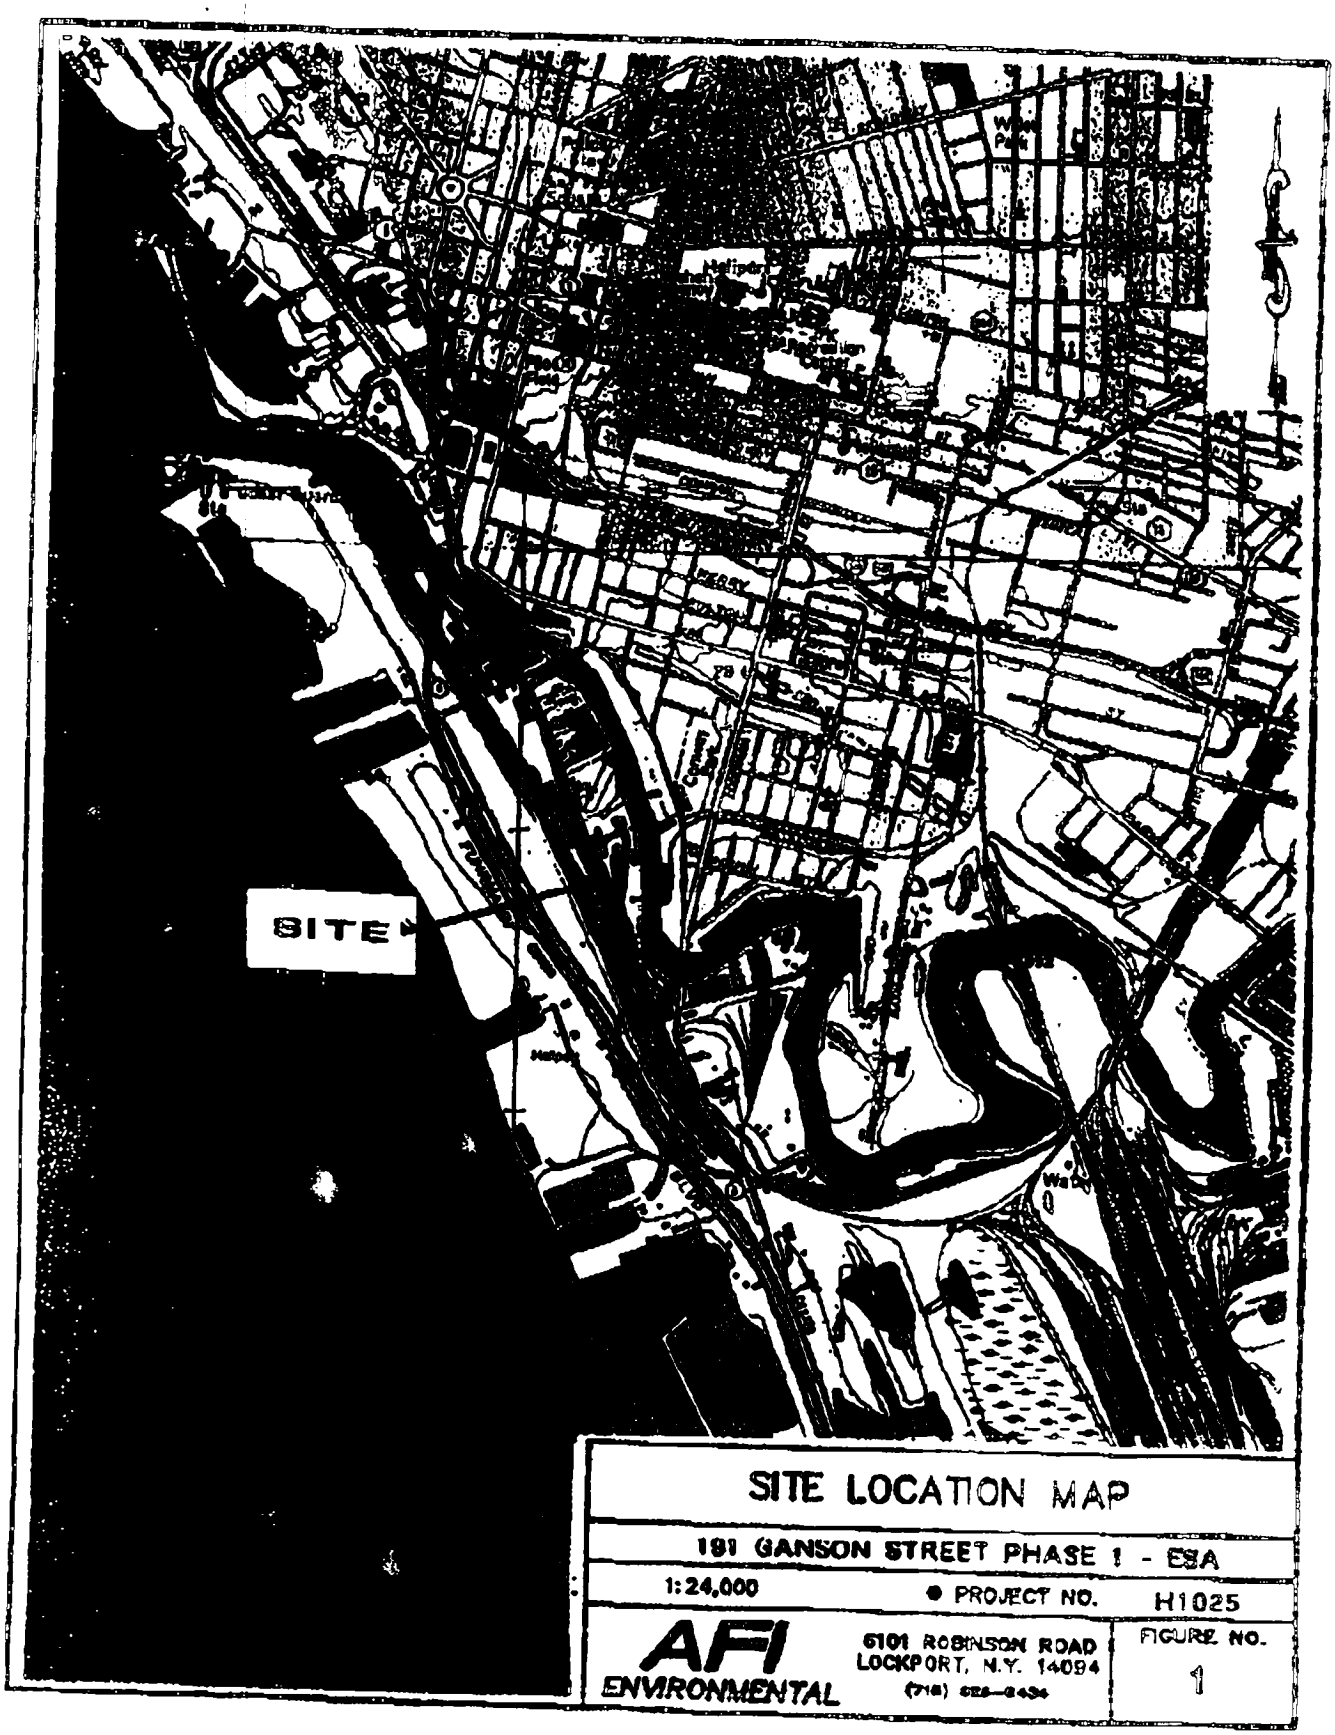
The proposed sampling techniques for soil sample collecting is described in the following subsections. All samples will be collected by an AFI Environmental field scientist and placed

in precleaned laboratory sample bottles, which will be labeled with the sample number, date and time of collection, sampler's initials, and the analysis requested.

4.1.1 Homogenized Composite Samples

Homogenized composite samples will be assembled to characterize background soil quality and to chemically profile soils contained within the area showing previous evidence of contamination.

4.1.2 STATISTICAL SAMPLING GRID



Each are to be investigated will be sectioned off into a statistical sampling grid consisting of two (2) components. The grids will be broken into near field and far field sections. The near field section will consist of the section within a square box whose length is 25 feet centered in the area of the original sampling location. The far field section will consist of a larger square box concentric to the first box, whose length is 125 feet. The near field section will be divided in a grid pattern where the intersections of the x and y axis are on 5 foot intervals, thereby creating 36 intersections. The far field zone will be divided into a grid pattern where the intersections of the x and y axis are on 25 foot intervals thereby creating a grid pattern with again 36 intersections. Five (5) subsamples will be randomly collected from each section and homogenized into a composite sample from each section with a total of two (2) samples from each area to be analyzed for TCLP Stars Volatiles and TCLP Stars Base Neutrals. These will result in a total of six (6) samples plus, field duplicate to be sent to Lozier Labs for analysis.

4.2 ANALYTICAL TESTING

All soil and sediment samples will be transported under proper chain of custody records to Lozier Laboratories, Rochester, New York, immediately following collection. All samples will undergo testing for the Toxicity Characteristic Leaching Procedure (TCLP) STARS Volatiles 1311(8021), and semi-volatile organic compounds (SOCs) in accordance with EPA SW-846 Method 1-311/8220. These analytical methods were selected based upon discussion with Waste Management of New York personnel and due to the types of contaminants identified as a result of earlier investigations of the project site. In addition to internal laboratory quality assurance/quality control (QA/QC) procedures, one (1) field duplicate will be analyzed.

5.0 CONCLUSIONS

Comparisons of the analytical data with applicable regulatory standards and/or guidance values will indicate the toxicity characteristics with respect to constituents analyzed. The data will be adjusted to correct for the dilution factor and compared to the applicable regulatory standards to determine if disposal is warranted and to estimate the rough quantities of disposal.

RE: GANSON STREET (REVISED) PHASE 11 ENVIRONMENTAL INVESTIGATION.
AFI Project #h1025

Dear John:

Enclosed, please find the **REVISED** copy of the Environmental Phase 11 Investigation for Ganson Street, Buffalo, NY. I have incorporated your comments of 12/23/94 into the text where appropriate. In respect to the final comment of your fax, dated December 23, 1994 "... where did you obtain the values for allowable soil concentrations in Table 2?" The values presented are from the NYSDEC TAGM dated January 24, 1994 #HWG94-4046. (copy enclosed). The table has been edited to include this reference. This document also discusses the 100 factor.

Also, please find a copy of our invoice for the above referenced project.

Please review, and call me if you have any further questions or comments.

I will be in my Lockport office until Friday the 30 of December, However, I will e on vacation the week of January 1-8 1995.

Have a great and prosperous NEW YEAR.

Sincerely,

AFI ENVIRONMENTAL

William L. Heitzenrater

1.0 INTRODUCTION

AFI Environmental was retained by Waste Management to conduct a Phase II Investigation of the property located at 191 Ganson Street in Buffalo, New York. This property was the subject of a Phase I Environmental Site Assessment (ESA), performed by AFI Environmental (AFI), which identified several potential areas of environmental concerns (AEC's). Further investigation was conducted to assess the potential environmental impacts that may have occurred or were related to the AEC's. Specifically, AFI identified several AEC's which include, but may not be limited to, the following:

- Numerous petroleum stained areas both in the garage areas and the staging/parking areas;
- Soils in and around the area of the former gasoline underground storage tank (UST) were never sampled and analyzed to confirm that no leakage had occurred from the UST.
- The fill materials utilized to backfill the dry docks north of the site, have been shown to contain elevated levels of VOCs, PCBs and metals. Additionally, groundwater in this area has also been shown to contain elevated levels of acetone, methylene chloride and metals.
- Potential impacts on the site from contaminants in the Buffalo River.
- Potential impacts on the site due to contaminants released on the adjacent properties.
- Potential discharges, including petroleum products and other vehicle operational and maintenance products, into the combined sanitary/storm sewers on site.
- Historical uses of the property for industrial purposes.
- Potential impact to the soils and stormwater sewers in and around the staging areas from leakage of leachate from trucks and roll-offs during routine operations.

The Phase II investigation of the project site was conducted to assess whether the identified AEC's have resulted in environmental impacts on the site and to characterize groundwater beneath the site. The field aspects of this investigation involved the drilling of test borings, the installation of monitoring wells and the collection of soil and groundwater samples. Soil and groundwater samples obtained during this field program were submitted for chemical analyses to enable an evaluation of site conditions relative to regulatory policy. AFI has prepared this *Phase II Investigation Report* to summarize the field investigation; present the results of the chemical analysis of soil and groundwater samples; evaluate the analytical data

Printed on recycled paper to help protect the environment

with respect to applicable regulatory standards and/or guidance values; and to identify potential sources of contamination. No attempt was made to determine the actual boundaries of contamination, if found.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson Street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing Container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities include natural gas from National Fuel and electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York*, the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structures. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and Materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- o There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- o The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).

- o One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - spent non-halogenated solvents (F003, F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o The site itself is a listed petroleum bulk storage facility. Additionally, two petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:

Printed on recycled paper to help protect the environment

- o There are three LST (Leaking Storage Tanks) sites located within 0.5 mile radius of the subject property.

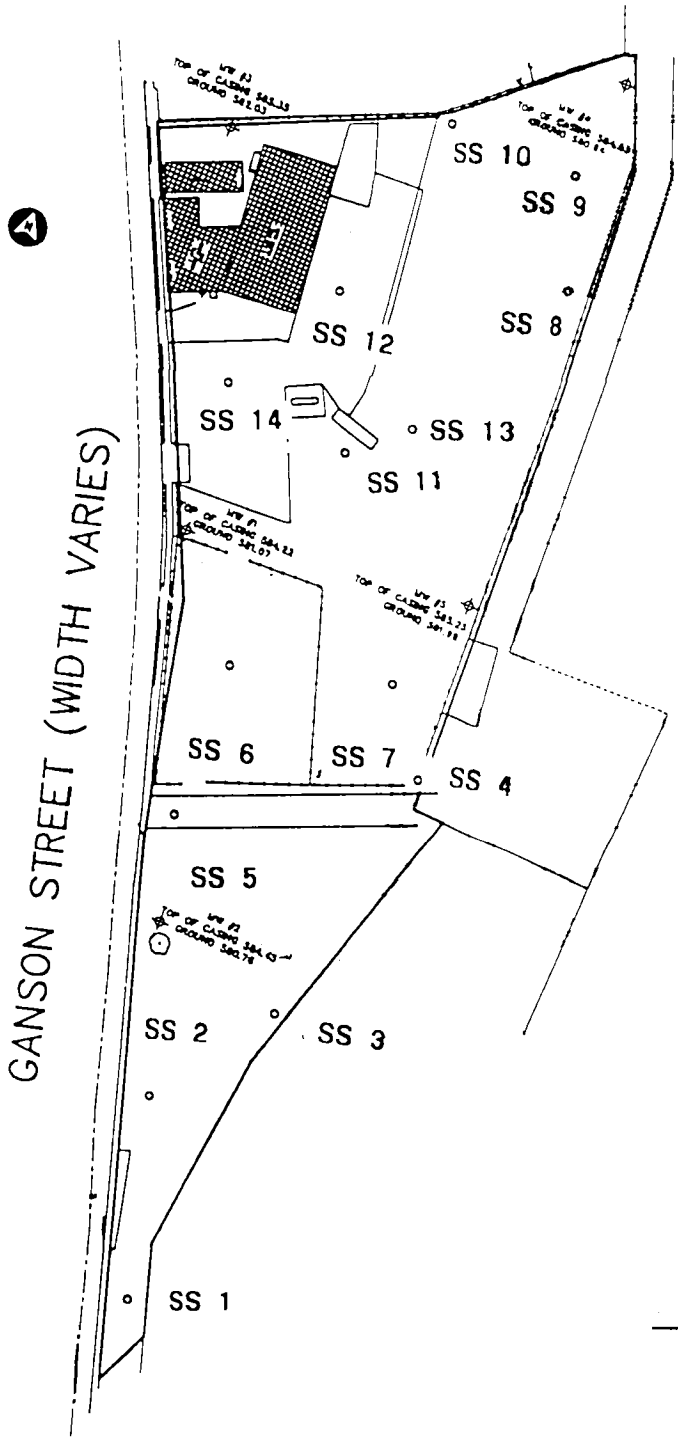
3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface of the subject property. The purpose of the investigation was to determine the presence or absence of contamination on the site.

4.0 METHODS OF INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental.

4.1 DRILLING, SOIL SAMPLING AND WELL INSTALLATION



Drilling, soil sampling and well installation procedures employed during this investigation as outlined in the following sections, are consistent with the collection of high quality data for hydrogeologic studies, and were selected based upon the collective experience of AFI Environmental staff and the drilling contractor, Advanced Drilling Investigations (ADI) of Niagara Falls, New York. All field work was directly supervised and documented by a qualified AFI Environmental Geologist, and the methods utilized were intended to minimize the potential for cross contamination. Five (5) groundwater monitoring wells and ten (10) soil borings were completed, and three (3) sediment samples collected at the site, the locations of which are depicted by Figure 3.

4.1.1 GROUNDWATER MONITORING WELLS

Overburden consisted of clayey silt, fine sand, silty sand, silty clay, and silty fine sand that was saturated at approximately 4-7 feet below ground surface. No odor or visual evidence of contamination was noted during drilling operations. The following paragraphs summarize the drilling, installation and design of these wells.

The installation of the wells was performed using a Mobile B-57 Drill Rig to advance 4 1/2" ID hollow-stem augers through unconsolidated geologic materials to a depth of approximately seventeen (17) feet. Soil samples were obtained continuously throughout the total depth of the boring using 2" OD split-barrel samplers in accordance with ASTM-D1586 procedures for Standard Penetration Test (SPT). Auger drilling proceeded with a steel plug inserted at the bottom of the auger stem to prevent material from entering the hollow stem and

to ensure accurate split-spoon sampling. The split-spoon sampler used was two (2) feet in length, unpainted, and equipped with a functional ball-check valve above the sample tube. The bottom of the sampling tube was equipped with a removable plastic "basket" retainer. The split-spoon was advanced through unconsolidated geologic materials at and below the bottom of the augers with a standard 140-pound hammer falling freely 30 inches. Blow counts were recorded for each six inches of penetration. Split-spoon samples were logged using the Unified Soil Classification System (USCS). Representative samples obtained from each split spoon were placed in appropriately labeled sample containers and immediately sealed with aluminum foil and screw on-cap. Field screening of soil samples obtained from split-spoons was conducted in accordance with the procedures outlined in Section 4.3.2.

Accurate test boring logs were prepared to document overburden stratigraphy and characteristics, depth to water, and all pertinent drilling observations.

Monitoring wells were installed immediately after auguring of the bore holes. The wells were constructed of two (2) inch diameter schedule 40, threaded, flush joint, PVC riser pipe and 10-slot PVC well screen. The screen was ten (10) feet in length, and fitted with threaded bottom plugs. The well screens were installed from approximately 7 feet below to 17 feet below the ground surface. A sand pack was gradually introduced to fill the annular space between the screen and the borehole wall. The sand pack extended from the bottom of the borehole to approximately one half (1/2) foot above the top of the screen. The sand pack consisted of washed, graded, silica sand with an average grain size and grain size distribution such that it was compatible with the screen slot size of 0.01 inches. A two (2) foot thick bentonite pellet seal was placed above the sand pack, and a cement/bentonite grout slurry extended from the top of the bentonite pellet seal to within one (1) foot of the surface. The well was completed by installing a six (6) inch steel casing with a stickup of approximately three (3) feet, with a locking cap. The grout was allowed to set up for 48 hours prior to well development. The well completion diagrams were prepared to document well construction details and material specifications and are included in Appendix A.

4.1.2 SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

4.1.3 SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as

Printed on recycled paper
to help protect the environment

described in section 4.3.2. Excess material collected from the catch basins was returned to the bottom of the catch basins.

4.2 WELL DEVELOPMENT

The following well development procedures were employed 48 hours after completion of the groundwater monitoring wells. This allowed the cement/bentonite grout sufficient time to set-up and enabled the wells to equilibrate. Prior to evacuation procedures the water level within the wells was measured with an audible signal, water level indicator to facilitate calculation of the volume of water within the well. Water was then evacuated from the wells using a decontaminated, plastic bailer. Well development continued until a minimum turbidity was achieved. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

4.3 SAMPLE COLLECTION/SCREENING AND ANALYSIS

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analyses. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were placed in appropriately labeled sample containers for transport under proper chain of custody records to Lozier Laboratories for chemical analyses. The following sections outline sample collection and screening procedures, and identify the analytical methods employed to chemically characterize the groundwater and soil samples.

4.3.1 GROUNDWATER

After well development, the monitoring wells were allowed to equilibrate for 24 hours. The static water level within the monitoring wells were measured using an audible signal water level indicator. After calculating the volume of water contained within each well, purging was initiated. Purging was accomplished using decontaminated plastic bailers. Well purging continued until at least 3 well volumes were removed or a minimum of turbidity was obtained. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

Groundwater sampling was performed within 24 hours after purging. The monitoring wells were sampled using decontaminated plastic bailers. The samples were placed in laboratory precleaned and prelabeled containers, appropriate preservatives were added, and the samples were placed on ice in a cooler for transport to Lozier Laboratories under proper chain of custody records. Five (5) groundwater samples underwent testing in accordance with EPA SW-846 3rd edition.

Printed on recycled paper
to help protect the environment.

4.3.2 SOIL

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNu PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. A summary of field screening results for VOCs is contained in Table #1. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0 ppm to 0.7 ppm for the ten (10) soil and (3) three sediment samples.

Two (2) samples from the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-846 Method 8240 for VOCs, TCL Semi-VOCs by Method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s , and Cyanide by Method 9012.

4.4 DECONTAMINATION

All drilling equipment such as augers, bits and sampling equipment which came in contact with subsurface materials was decontaminated via steam cleaning before and after drilling activities at each borehole. Equipment decontamination consisted of the removal of all soils with a high pressure, low volume, steam and detergent wash. Split-spoon decontamination was performed between samples and consisted of a detergent wash and potable water rinse.

The AFI geologist supervising the field investigation ensured that all equipment was properly decontaminated prior to use at the site, between each borehole, and before leaving the site.

4.5 CONTAINMENT OF WASTES

Drill cuttings from the installation of the monitoring wells were transferred into labeled DOT-approved 55 gallon drums to await proper disposal. Similarly, all decontamination fluids and liquids withdrawn from the groundwater monitoring wells during development, purging and sampling activities were contained within labeled DOT-approved 55 gallon drums to await proper disposal by the client.

5.0 ANALYTICAL RESULTS

5.1 SOIL

Printed on recycled paper
to help protect the environment

The Lozier laboratory report containing the analytical results for the soil samples analyzed via EPA SW-846 Method(s) 8240, 8270, 8080, 6010/7000 and 9012 are presented in Appendix C. This report also contains the case narrative, laboratory quality assurance/quality control (QA/QC) data, and chain of custody records. An initial review of the data indicated that the holding times for the 8080 Pesticides/PCBs and the TCL Semi-VOCs 8270 soil samples were exceeded prior to analysis. These samples were destroyed and resampled on December 6, 1994. All data reported within this report was analyzed within the required holding times, laboratory blanks were free of contamination, and all QC data were acceptable. These data are summarized and discussed in Section 6.0.

5.2 GROUNDWATER

The results of the chemical analysis of the five (5) groundwater samples collected from the onsite monitoring wells are presented in Appendix D. Additionally, the case narrative, laboratory QA/QC data and chain of custody records for these samples are presented therein. All groundwater samples were analyzed within the required holding times, surrogate standard recoveries were within acceptable limits (except for the low acid recoveries due to matrix interference on method 8270 for samples 1,3,4,5 and sample 6 for method 8080), and laboratory blanks were free of contamination. Section 6.0 contains a summary and evaluation of these groundwater data.

6.0 CONTAMINATION ASSESSMENT

An evaluation of the data resulting from the chemical analysis of soil and groundwater samples collected from the project site, including data from previous studies, was performed with respect to the following:

- o Type of Contamination
- o Potential Sources of Contamination
- o Compliance with Applicable Regulatory Guidelines

The succeeding subsections provide an assessment of the subsurface conditions at the project site, based upon available data, and provide the foundation for the recommendations concerning further investigation and/or remediation of the site discussed in Section 8.0.

6.1 SOIL

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum contstituents, possibly from fuel oil. Table 2 presents a summary of these results in a comparative format which includes the guidance values for each parameter as specified in the NYSDEC publication: *Spill Technology and Remediation Series (STARS) Memo #1 and/or*

Printed on recycled paper
to help protect the environment

NYSDEC Soil Cleanup Objectives and Cleanup levels TAGM (January 24, 1994). As illustrated by Table #2, and discussed within the laboratory case narrative, all sediment samples were diluted, prior to analysis, due to the presence of a brown viscous petroleum hydrocarbon within the sample extract. The dilution of the sample raised the detection limits far above the NYSDEC guidance values by several orders of magnitude. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location # 9.

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10) and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data presented in Table #1. A further review of the same table reveals that not all samples locations exhibited VOC's. This may indicate that the impacts from the petroleum releases to the soil is limited. This assumption is supported by the lack of VOC's during the screening of the split spoon samples and the lack of any VOCs in the groundwater samples collected from the site. Therefore one could assume that not all areas of the site are contaminated with petroleum constituents.

6.2 GROUNDWATER

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. These data are summarized in Table #3. Based on a comparison with applicable guidance values established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the contaminants encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that contaminants originating from areas off-site are not migrating on-site via the groundwater flow system and that onsite contaminants are not migrating offsite via the groundwater system.

7.0 CONCLUSIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if contaminated soil was present and to characterize groundwater quality. In general, contaminated soil was encountered in varying degrees in the areas sampled. In this case we don't know that the values exceed the NYSDEC requirements because of the analytical method selected for analysis. It isa possible that some of the particular constituent levels could exceed the NYSDEC STARS limits, but this is unknown because TVLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCs, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location # 14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260,

Printed on recycled paper to help protect the environment.

normally of low mobility, was detected in all samples, with the highest value recorded in the staging/refueling area. PCBs may be resulting from fill brought on-site prior to Downing Container's existence, or it maybe a result of current activity and made mobil via the liquid petroleum fraction in the soils.

Groundwater samples collected from the five (5) overburden monitoring wells were clean. No contravention of NYSDEC guidance values for drinking water standards, in the areas monitored, has occurred. The placement of the monitoring wells near the periphery of the site indicates that no contaminants are entering or leaving the site via the groundwater flow system of the overburden, in the areas monitored.

8.0 RECOMMENDATIONS

Based upon the analytical data generated during the course of this investigation and a review of NYSDEC Petroleum-Contaminated Soil Guidance Policy, AFI Environmental recommends that a more extensive soil/sediment investigation be conducted. The objective of this program, would be to determine the concentrations, distribution (horizontal and vertical) and source of petroleum and PCB-1260 constituents in the soil. Once the boundaries, source and extent of the constituents, are defined, a corrective action program could be implemented. This would allow remediation of the site soils to within levels that are protective of human health and the environment.

However, recognizing that the site is located in a highly industrialized area and that the site is not currently leaching constituents into the groundwater or offsite via groundwater, a combination of testing, soil remediation, and paving with asphalt, concrete, or other impermeable semi-permanent material may warrant consideration.

The ultimate selection of the remedial method should be based upon further soil investigation and a number of parameters, including but not limited to effectiveness, potential impacts to human health and the environment, cost, and compatibility with the current commercial nature of the site. AFI also recommends that the NYSDEC be consulted regarding acceptable clean-up levels at the site, as well as the means by which these objectives will be achieved; once additional data has been collected and reviewed.

9.0 LIMITATIONS

This report is based upon the application of scientific principles and professional judgement to certain facts with resultant subjective interpretations. Professional judgements expressed herein are based on the facts currently available within the limits of the existing data, scope of services, budget and schedule. To the extent that more definitive conclusions are desired by the client than are warranted by the current available facts, it is specifically AFI

* NYSDEC Guidance Values from Jan 24, 1994 TAGM-Determination of Soil Cleanup Objectives and Cleanup Levels. HWR94-4046.

Allowable soil concentrations may be increased by a factor of 100 if the contamination is in the unsaturated zone above the water table. The value of 100 for correction is consistent with the logic used by EPA in its Dilution Attenuation Factor (DAF) approach for EP Toxicity and TCLP. (reference TAGM HWR94-4046).

Soil cleanup objectives are obtained by multiplying the allowable soil concentration by the correction factor.

Analysis performed by EPA Method 8080 Organochlorine Pesticides and PCB's on 11/29/94 and extracted on 12/08/94.

*High % recovery due to matrix pattern interference (acceptable range: 34-183%).

**Percent Solids analysis performed by EPA Method 160.3 on 12/09/94.

Attn: Mr. Robert N. Lacey, P.E.

Re: Removal & Disposal
of Underground Tank

Gentlemen:

Please be advised that the Elmwood Tank & Piping Corporation has been awarded the contract to clean, gas free and legally dispose of the following underground tank and its contents, as per D.E.C. Regulations, at the listed location:

LOCATION: Downing Container Service
191 Ganson Street
Buffalo, New York

SIZE: 1-4,000 Gallon Steel Tank

We are proceeding with the removal of the aforementioned underground tank on November 24, 1987 in accordance with your verbal approval of our telephone conversation of November 18, 1987.

If you require further information, please do not hesitate to contact us.

Very truly yours,

ELMWOOD TANK & PIPING CORP.

1.0 EXECUTIVE SUMMARY

The following details the findings of Benchmark Environmental Engineering & Science, PLLC (Benchmark) relative to identifying RECs for 145 Ganson Street (aka 127 Buffalo River and 189-191 Ganson Street), Buffalo, Erie County, New York (Site).

1.1 General Information

Benchmark has performed a Phase I ESA of the Site in conformance with the scope and limitations of ASTM Practice E 1527-13 and the protocols required by the Client. This section summarizes the findings of the environmental professional relative to the Site. The reader is encouraged to read the entire report.

1.2 Site Description

The Site is located in a highly developed industrial area of the City of Buffalo, New York (see Figure 1). As shown on Figure 2, two structures are present on the Site. Building 1 is a truck maintenance garage and washing station, and office. The original western portion of Building 2 is vacant and an addition to the east is a storage area for truck parts, empty drums, and old vehicles. The Site consists of three parcels totaling approximately seven-acres and is supplied with municipal sanitary sewer, electric, natural-gas and public water. Information relative to the specific parcels subject to this assessment, as provided by the City of Buffalo municipal offices, is provided below:

Parcel Address	Size (acres)	Tax ID No.	Current Owner	Current Use
127 Buffalo River	2.20	122.13-4-2	George W. Burnett, Inc.	Truck maintenance and office (Building 1)
189 Ganson Street	4.05	122.13-4-1.11		Parking lot
191 Ganson Street	0.75	122.09-2-4		Storage

1.3 Data Gaps

The following data gaps[1] were identified in completion of this inquiry.

Type of Data Gap	Details of Data Gap	Sources Consulted	Significance
Historical Information	Historical information for the Site was not available at five-year intervals.	Previous studies, city directories, aerial photographs, Sanborn maps, topographic maps and municipal information.	This data gap did not significantly limit Benchmark's ability to provide an opinion on RECs related to the Site.
Abstract of Title	The abstract of title was not available for review at the time of report preparation.	Current property owner (i.e., user of this report).	This data gap did not significantly limit Benchmark's ability to provide an opinion on RECs related to the Site.
Site Reconnaissance	Parked vehicles and stored materials/equipment hindered observations at the time of the Site reconnaissance.	Site reconnaissance	This data gap did not significantly limit Benchmark's ability to provide an opinion on RECs related to the Site.

1.4 Environmental Report Summary

1.4.1 Summary of Site Reconnaissance Potential Concerns

The following potential environmental concerns were identified at the time of the Site reconnaissance:

- Building 1 is currently used as an automotive repair operation with associated storage and use of hazardous/regulated materials.
- Automotive-related fluids including oils, brake fluid and antifreeze were noted in Building 1 in 55-gallons and containers of five-gallons or less. Additional containers of diesel exhaust fluid, synthetic lubricant, specialized lubricant, paints, hydraulic oil, transmission fluid, compressor lubricant, power steering fluid, concrete remover and cleaner, degreaser, soap, and aluminum cleaner were also noted.
- A 55-gallon drum of waste oil was observed off-Site adjacent to the northeast corner of the Site. The drum was tipped on its side; however, no concerns (staining, stressed

[1] A data gap is defined by 40 CFR 312.10 as "a lack of or inability to obtain information required by the standards and practices" of preparation of this document "despite good faith efforts by the environmental professional" or others to gather such information.

vegetations, odors, etc.) were observed proximate to the drum and within the Site property boundary.

- Hazardous/regulated wastes are generated in connection with automotive repair operations at Building 1. According to the Site contact, wastes generated on-site include used motor oils.
- Benchmark was informed by the site contact that all waste oils are burned on-Site within a waste oil burner.
- One 10,000-gallon diesel fuel AST is located north of Building 1 within secondary containment.
- Concrete ground surfaces throughout the Site were observed, particularly south and northeast of Building 2. These concrete areas are reportedly indicative of former UST fields and pump island areas. The Site contact verified these areas to be locations of previously removed USTs and pumps.
- An unknown pipe, approximately 1.5-inches in diameter, is protruding vertically from the ground surface inside the northeast corner of Building 1 and exits the exterior wall approximately four-feet above the ground. It is disconnected outside the building. The Site contact did not know the origin or use of the unknown pipe.
- A used oil AST is located within Building 1 which is used for collection of oil consumed by an overhead furnace/waste oil burner located in the maintenance area. Additionally, a moveable pan filled with oil was located proximate the tank.
- A 200-gallon AST is located within Building 1. It is labeled Super-D XA Diesel Engine Oil with Liquid Titanium SAE 15W-40.
- Trench style floor drains are located throughout Building 1 within the maintenance area and truck wash area.
- The Site contact indicated the floor drains outlet to an oil-water separator located north of Building 1 prior to discharge to the Buffalo Sewer Authority combined sewer system located on Ganson Street.
- Multiple 55-gallon drums of unknown materials are located within Building 2. The Site contact indicated these drums to be empty; however, Benchmark could not visually confirm.
- Black staining, believed to be waste oil, was observed on the ground surface within Building 2. The Site contact indicated the staining to be a result of the Site owner performing general maintenance to a personal vehicle.
- Miscellaneous stored materials including numerous truck parts and tires are stored within Building 1 and Building 2 on shelving and concrete ground surfaces. Additional miscellaneous debris is located on the north exterior of Building 1.

- Two small pile of stone fill material and one pile of miscellaneous fill material are located along the eastern portion of the Site.
- Based on the urban location of the Site and former buildings, it is possible that fill materials from unknown origins were brought to the Site.
- Numerous asphalt disturbances were observed by Benchmark in paving and stone parking areas, mostly in high traffic areas.
- Four existing monitoring wells, installed as part of previous subsurface investigations completed by others, were noted in the northern portion of the Site.
- Adjacent properties are currently utilized for industrial purposes, including manufacturing and warehousing. No concerns (staining, odors, obvious spills, etc.) were noted on-Site in connection with current adjacent operations.

1.4.2 Summary of Historic Uses

Approximate Years	Reported or Suspected Use	Owner/Occupant
At least 1889 through current	Current operations include truck maintenance, a truck washing station, office space and storage for truck parts, empty drums, and old vehicles. Historic operations included a mix of industrial, commercial, and residential uses. Sanborn maps indicate various structures and operations throughout these years including lumber sheds, iron ore yards, machine shops, tin shops, railroads, commercial buildings, and restaurants. Various railroad tracks also appeared on-Site. In addition, trucking, container, and transportation, and construction companies were on-Site. Previous studies indicate that Site was historically used as a storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, roll off and rental operations. Multiple residential structures were formerly present along Ganson Street. Municipal records and regulatory records indicate installation of at least 14 USTs between 1949 and 1980, and removal of at least eight USTs between 1986 and 1988. The exact locations of several USTs were not identified in historical records. The number of tanks installed versus the number of tanks removed does not correspond which is not uncommon for a Site such as this.	Current owner: George W. Burnett Inc. Past owners/occupants include J. Lloyd, Earl Roberts, American Shipbuilding Co., Buffalo Dry Dock Co., Great Lakes Transit Corp., Earl Roberts, Waste Management/Downing Container Service Inc., N&K Cartage Co. Inc., Lake Erie Transportation Co. Inc., Roy Track Inc., and Carlson Truck Service.

1.4.3 Summary of Previous Studies

A previous Phase I completed by AFI Environmental in 1993 for 189-191 Ganson Street identified RECs including petroleum staining, a former UST area with no confirmatory soil sampling, fill material, and historic industrial use.

A Limited Phase II completed by AFI in 1994 included installation of monitoring wells and soil/sediment sampling. Groundwater was reportedly measured at depths ranging between 2.88 and 8.02 fbgs. AFI indicated that elevated VOCs and SVOCs were detected in sample areas proximate to former UST and fueling/waste container locations and one sludge/sediment sample taken from a surface runoff inlet indicated elevated levels of VOCs, particularly acetone (39,000 ppb) and toluene (62,400 ppb). PCBs were also detected. According to AFI, no impacts were identified in groundwater samples collected from the Site.

A Remedial Action Plan was completed by AFI Environmental for Waste Management in 1995. The purpose of the work was to further investigate the areal extent and composition of impact constituents to identify the cost to mitigate existing soil/sediment contamination at the Waste Management facility. [Previous studies indicate that Site was historically used as a storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, roll off and rental operations.] Additional investigation activities included five additional soil samples from three distinct areas of concern identified by AFI as a former UST Area (Area 1), a former roll off dumpster staging area (Area 2), and the gas island/storm sewer inlet area (Area 3). Five soil samples from 6" to 18" were collected and homogenized and analyzed for TCLP VOCs and TCLP SVOCs. Laboratory analytical results revealed an exceedance of naphthalene at one location at a concentration exceeding applicable regulatory criteria. AFI recommended excavation activities on-Site.

Limited remediation activities completed by AFI in 1995 under Spill No. 9501488 involved removal of soil (identified as a 20' x 20' x 2.5' area) from a former UST area, removal of soil (identified as a 25' x 25' by 18" area) from a roll off staging area, and excavation of staining in parking lot areas near pump islands and vehicle parking areas. In addition, sediment removal and cleaning of storm drains was completed.

An October 30, 1995 letter from the NYSDEC to Waste Management indicates that the Department reviewed the analytical results from post excavation soil samples and they are not recommending further work since the results were "low levels."

In Benchmark's opinion, the previous Phase II and remediation activities completed at the Site were insufficient to fully assess/address the Site.

See Section 5.4.8 below for additional information relative to previous assessments.

1.4.4 Regulatory Information

Site Listings

Site Database Listings	Address/Name	Summary
NY LTANKS, NY UST, NY AST, NY Spills	145 Ganson Street/George W. Burnett Inc.	Four USTs and one AST are listed as being registered at 145 Ganson Street/George W. Burnett Inc. as follows: USTs Tank 001 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 002 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 003 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 004 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. AST Tank 1 – 10,000-gallon diesel AST installed August 1, 1995 is listed as being "in service" as of April 14, 2017. Benchmark can verify that this tank is currently operational and located on-Site, north of Building 1. The following spill incidents were identified for 145 Ganson Street: Spill No. 8708580, dated January 4, 1988, involved petroleum contaminated soils found during tank removal activities. Contamination was reported as "not significant" and the spill was classified as "closed" by the NYSDEC on January 4, 1988.

		Spill No. 9501905, dated May 1, 1995, involved George W. Burnett Inc. using a 6,000-gallon tanker truck, which is reportedly prohibited. The owner received a permit to install a 10,000-gallon AST and the spill was classified as "closed" by the NYSDEC on May 12, 1995. There is no indication that a release occurred.
NY RGA LF, NY SWF/LF	189-191 Ganson Street/Wargo Enterprises/Wargo Enterprises at John A. Bauer	Wargo Enterprises is listed as Recovered Government Archive Solid Waste Facilities/Landfill Site from at least 2009 through at least 2012. Wargo Enterprises is also listed as a Solid Waste Facility/Landfill Site registered as a construction and demolition debris processing facility, authorized on May 6, 2009. Wargo Enterprises at John A. Bauer is listed is the FINDS database.
NY LTANKS, NY UST, NY AST, NY Spills, RCRA NonGen/NLR, FINDS, ECHO	191 Ganson Street/George W. Burnett Inc./Railroad Crossing/Ganson St/Tractor Trailer Accident/Waste Mgmt. of NY Downing Container Sv.	Two USTs and four ASTs are listed as being registered at 191 Ganson Street/George W. Burnett Inc. as follows: <u>USTs</u> Tank 1 – 4,000-gallon gasoline UST installed October 1, 1966 is listed as being "closed prior to micro conversion" in March 1991. Tank 2 – 10,000-gallon diesel UST installed May 1, 1980 is listed as being "closed – removed" on December 1, 1996. <u>ASTs</u> Tank 3 – 500-gallon unreported material AST installed January 1, 1974 is listed as being "converted to non-regulated use." A tank closed date is listed as December 1, 1991. Tank 4 – 275-gallon kerosene (#1 fuel oil) AST installed January 1, 1974 is listed as being "closed – removed" on January 1, 1995. Tank 5 – 275-gallon unreported material AST installed on January 1, 1974 is listed as being "closed – removed" on January 1, 1995. Tank 6 – 275-gallon unreported material AST installed January 1, 1974 is listed as being "closed –

		removed" on January 1, 1995. The following spill incidents were identified for 191 Ganson Street: Spill 9501488, dated May 1, 1995, involved unknown petroleum contamination at George W. Burnett Inc. found during a Phase I and Phase II investigation. The spill was classified as "inactive" by the NYSDEC on October 26, 1995. Spill No. 9611387, dated December 16, 1996, involved approximately 20-tons of diesel fuel contaminated soils found at George W. Burnett Inc. around a fill port during removal of a 10,000-gallon diesel fuel UST. Water samples and sidewall/bottom excavation soil samples were collected and analyzed. The spill was classified as "closed" by the NYSDEC on June 20, 1997. Benchmark suspects that this spill is associated with registered Tank 2 as dates and contents reported are consistent. Spills No. 1505539 and 1505541, dated August 23, 2015, involved the release of 8-gallons of diesel fuel due to a broke down tractor trailer near railroad tracks and onto the street. It was reported no fuel reached soils or waterways. Spill No. 1505539 was classified as "closed" by the NYSDEC on February 2, 2016 and Spill No. 1505541 was "closed" on August 24, 2015. Waste Management of NY Downing Container Services is listed as a RCRA non-generator of hazardous wastes with no reported violations. This property was historically listed as a large quantity generator of hazardous wastes including, but not limited to, ignitable wastes. Waste Management of NY Downing Container Services is also listed in the FINDS and ECHO databases.

Adjacent Property Listings

Adjacent Database Listings	Address/Name	Summary
NY Spills, NY SPDES, SEMS, RCRA CESQG, US AIRS, FINDS, ECHO, NJ/NY/PA	250 Ganson Street/ADM Milling Co./Industrial Site/250 Ganson Street to Pavement/Roadway/Pillsbury	Numerous NYSDEC registered Spills are associated with 250 Ganson Street. All spills are classified as "inactive" or "closed" by the NYSDEC.

Manifest	Co./Train Tracks 250-259 Ganson Street/ADM Plant	SPDES permit no. NYR00E008 is associated with ADM Milling Co. to discharge to Lake Erie. ADM Milling Co. is listed in the Superfund Enterprise Management System. ADM Milling Co. is also listed as a RCRA conditionally exempt small quantity generator of hazardous wastes with no reported violations. Historic generator at this property include The Pillsbury Co. Hazardous wastes include, but are not limited to PCBs. 250 Ganson Street is also regulated by the US AIRS database as part of the US EPA Risk Management Plan for companies that handle, manufacture, use, or store flammable or toxic substances. The property is also listed in the FINDS and ECHO databases. NJ, NY report off-site disposal by ADM Milling Co. of hazardous wastes including, but no limited to, ignitable wastes, cadmium, chromium, lead. PA Manifests report off-site disposal by The Pillsbury Co. of hazardous wastes including, but not limited to, ignitable wastes.
NY Spills	95 Ganson Street/Construction Site	Spill No. 1800067, dated April 3, 2018, involved two-gallons of hydraulic oil to gravel surface. The spill was cleaned and classified as "closed" by the NYSDEC on April 4, 2018.
NY Spills, Abandoned Mines, RCRA-LQG, FINDS, ECHO, NY UST, NY Manifest	201 Ganson Street/Buffalo Industrial Diving/Metso (Nordberg) No. SN20360448/USEPA Buffalo River Dredging Notification of PCB Activity	Spill No. 1075467, dated December 31, 2001, involved 50-gallons of diesel fuel released to the Buffalo River from a docked boat. The spill was classified as "closed" by the NYSDEC on January 12, 2002. Spill No. 0175122, dated May 31, 2001, involved petroleum contamination environmental investigations. Monitoring wells installed during the investigation were test on April 17, 2003 and continued to show slight exceedances of groundwater standards. Therefore, the property was classified as "inactive" by the NYSDEC on April 17, 2003. Metso (Nordberg) No. SN20360448 is listed as an abandoned surface mine as of April 17, 2012. USEPA Buffalo River Dredging Notification of PCB Activity is listed as a RCRA large quantity generator

		of hazardous wastes with no reported violations. Historic generators for the property include Cowper Siegfried Construction. Hazardous wastes include, but are not limited to, ignitable wastes, spent non-halogenated solvents, and spent halogenated solvents. This property is also listed in the FINDS and ECHO database. NY Manifest database indicates off-site disposal of 16,738 kg of PCB wastes transported in dump trucks to a landfill. Two USTs are listed as being registered at 201 Ganson Street/Cowper Siegfried Co., Inc. as follows: Tank 001 – 8,000-gallon diesel UST installed August 1, 1973 is listed as "closed – removed" on May 1, 1989. Tank 002 – 4,000-gallon gasoline UST installed August 1, 1973 is listed as being "closed – removed" on May 1, 1989.

1.4.5 Other Findings

The historic industrial use of the Site along with numerous documented USTs represent a potential VEC.

1.4.6 Interviews/Questionnaires

The current president of G.W. Burnett, Inc., Eric Bauer, completed Benchmark's Environmental Questionnaire and identified the Site as having a history of trucking and maintenance. Mr. Bauer also identified the Site as having a history of lime storage for a nearby concrete manufacturer.

The City of Buffalo Building Inspector would not provide Benchmark with an interview regarding the Site. However, Captain Ron Barret of the Fire Prevention Department and Assessor Mr. Dean Martz were interviewed. Both individuals did not have knowledge of environmental concerns associated with the Site.

1.5 Report Findings

Where applicable for the Site, the following is a list of RECs, CRECs, HRECs, and de minimis conditions. Non-scope considerations are also provided.

RECs

Per ASTM E1527, a REC is the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

Benchmark's investigation revealed the following RECs in connection with the Site:

- The long history of commercial and industrial operations (i.e., machine shops, tin shops, iron ore yards, railroads, shipbuilding companies, trucking companies with repair, and construction companies) with numerous USTs and various regulatory listings. In addition, the Site was historically used as a storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, roll off and rental operations.
- Concrete reportedly associated with former USTs/pump island areas were observed by Benchmark during the site visit as was black staining.
- The oil/water separator is considered a REC as the integrity of the oil/water separator is unknown.
- The unknown pipe identified protruding from the ground in the northeastern corner of Building 1 is considered a REC as the exact nature of the pipe is unknown and could not be verified by the Site contact.
- The numerous 55-gallon drums/barrels located in Building 2 are considered RECs as Benchmark could not verify the contents of the drums/barrels.
- It is possible that impacted fill material from unknown sources was brought to the property to use as backfill across the Site including a former boat slip area and former structure areas.

Controlled RECs

Per ASTM E1527, a CREC is a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the

applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

Benchmark's ESA did not reveal CRECs for the Site.

Historic RECs

Per ASTM E1527, a HREC is a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). For example, a spill that has been remediated to the satisfaction of the appropriate regulators would be considered a HREC.

Benchmark's investigation revealed the following HRECs for the Site:

- The "closed" and "inactive" spill incidents identified for the Site are considered HRECs as such have been addressed to the satisfaction of the NYSDEC. However, should the NYSDEC decide to reopen a spill incident or if environmental impacts are encountered during future site work, such would be considered a REC.

De-minimis Conditions

In accordance with ASTM E-1527, de-minimis conditions are conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de-minimis conditions are neither RECs nor CRECs.

Benchmark's investigation revealed the following de-minimis conditions for the Site:

- The miscellaneous stored materials (used tires, etc.) noted at the Site are considered de-minimis conditions as no obvious concerns (staining, odors, etc.) were noted proximate to the materials.

Non-Scope Considerations

Per ASTM E1527-13, non-scope considerations are described as ancillary observations during performance of the on-site investigation. Non-scope considerations are not considered RECs under ASTM E1527, but may represent health or environmental issues impacting the Site and/or property value.

Benchmark's investigation identified the following non-scope considerations:

- Based on the ages of the existing buildings, the potential for suspect ACMs and lead exists. Asbestos and/or lead, if present, should be properly handled as part of future renovation/demolition activities.
- No visual evidence of mold was noted at the time of the Site reconnaissance.
- 100-year and 500-year flood zones were identified for the southern portion of the Site.
- Research in the area of the Site completed by the New York State Department of Health - Bureau of Environmental Radiation Protection (Radon) suggests an average basement radon concentration of 1.14 pCi/L in the area of the Site, which is below the USEPA action level of 4.0 pCi/L. As such, radon is not anticipated to be a concern.

1.6 Opinion

In Benchmark's opinion, the previous Phase II and remediation activities completed at the Site by others were insufficient to fully assess/address the Site. As such, due to the RECs identified above, Benchmark recommends completion of a supplemental Phase II Environmental Investigation to assess subsurface soil and groundwater conditions at the Site.

2.0 INTRODUCTION

2.1 Purpose

The primary purpose of this assessment was to provide SpotOne, LLC with sufficient information about the potential environmental risks associated with the Site.

A secondary purpose of this study was to document the inquiry of the environmental professional for all appropriate inquiries for the Site. Specifically, this document is intended to provide the "all appropriate inquiries" for the purposes of CERCLA Section 101(35)(B). Such is applicable to persons seeking to qualify for: (i) the innocent landowner defense pursuant to CERCLA Sections 101(35) and 107(b)(3); (ii) the bona fide prospective purchaser liability protection pursuant to CERCLA Sections 101(40) and 107(r); and (iii) the contiguous property owner liability protection pursuant to CERCLA Section 107(q). This report was not intended as part of the Site characterization and assessment with use of a grant awarded under CERCLA Section 104(k)(2)(B). More specifically, the scope is intended to identify conditions indicative of releases or threatened releases of hazardous substances in, on, or at the Site.

2.2 Scope of Work

The scope of work is intended to identify RECs at the Site, including the following tasks:

A) Review of information provided by the User of this Report regarding commonly known or reasonably available information about the Site.
B) Interviews with past and present owners, operators and occupants (if available).
C) Review of historical sources of information documenting the Site's use.
D) Review of Federal, State, tribal and local government records.
E) A visual inspection of the Site and adjoining properties (to the extent possible).
F) Preparation of this written report.

2.3 Significant Assumptions

No significant assumptions were made during completion of this study other than as identified Section 2.4.

2.4 Limitations and Exceptions

2.4.1 Limitations

To the extent of our knowledge, the information contained in this Report is true and accurate. Benchmark personnel have exercised due diligence in the compilation of the information contained herein appropriate to environmental professionals engaged in investigations of this nature. Benchmark makes no guarantees regarding the accuracy of information gained from other sources.

This Phase I ESA is based on current and historical information reviewed by Benchmark and their Site inspection. This Report is not to be considered an environmental audit of the Site or a complete environmental investigation of the Site. Further, the purpose of this assessment is not to proclaim a property is devoid of environmental impact but rather to identify RECs, as defined above.

This Phase I ESA makes no warranties nor implies any liability regarding:

1. Site specific practices and/or disposal methods of the past or future owners.
2. Adjacent property owners, their environmental practices and/or impact of such properties and practices on the subject property other than observed from the subject property.
3. Unreported spills.
4. Practices, waste disposal, environmental concerns and/or modifications to waste site indexes after the date on this Report.
5. Site groundwater or soil conditions.
6. Accuracy or completeness of information supplied to Benchmark by others.
7. Environmental conditions in areas not practically or safely accessible.
8. Accuracy of previous studies (if any) provided to Benchmark.

This Report is also subject to any and all limitations defined within ASTM E1527-13. This includes, but is not limited to, the limitation that this Report is intended to identify environmental conditions at a specific time and is only valid for a period of six months from the date of issuance.

The principles defined within ASTM E1527-13, and followed within this study, include the following.

- This practice is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs in connection with a property.
- All appropriate inquiry does not mean an exhaustive assessment of a clean property. One of the purposes of this practice is to identify a balance between limiting costs/time and the reduction of uncertainty about unknown conditions.
- The level of inquiry is variable and depends on the type of property, risk level of the user and information developed in the course of the inquiry.
- Subsequent environmental assessments should not be used as standards to evaluate the appropriateness of prior inquiries based on hindsight, new information or new techniques.

2.4.2 User Responsibilities

The following information is the responsibility of the user and not of the environmental professional. This information may be provided by the user to the environmental professional for use in the final opinion of the all appropriate inquiry. If the information is not provided by the user, the environmental professional's ability to render such an opinion may be hindered and identified as a data gap.

- Searches for environmental cleanup liens against the subject property that are filed or recorded under any Federal, State, tribal, or local law, as required by 40 CFR Section 312.25.
- Assessments of any specialized knowledge or experience on the part of the landowner, as required by 40 CFR Section 312.28.
- An assessment of the relationship of the purchase price to the fair market value of the subject property, if the property was not contaminated, as required by 40 CFR Section 312.29.
- An assessment of commonly known or reasonably ascertainable information about the subject property, as required by 40 CFR Section 312.30.

2.4.3 User Protections

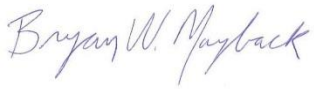
Persons claiming the liability protections under CERCLA must meet the statutory requirements of one of the following landowner liability protections. [It should be noted that the user must also satisfy certain continuing obligations outside the scope of this Phase I Environmental Assessment, as required by CERCLA].

- The innocent landowner defense pursuant to CERCLA Sections 101(35) and 107(b)(3).
- The bona fide prospective purchaser liability protection pursuant to CERCLA Sections 101(40) and 107(r).
- The contiguous property owner liability protection pursuant to CERCLA Section 107(q).

2.5 Deviations

There were no deviations from the ASTM 1527-13 standard during the completion of this study except that a regulatory file review was not completed. Specifically, while a NYSDEC file review would typically be required under the ASTM standard for Site and adjacent property regulatory listings, such was not completed by Benchmark as: regulatory listings were not identified; completion of the file review was not anticipated to provide new or significant information; or records were not considered reasonably ascertainable in the timeframe of the report deliverable.

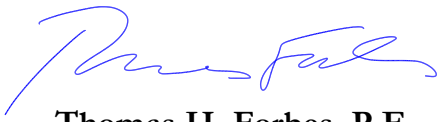
2.6 Special Terms and Conditions



The work was completed in accordance with Benchmark's proposal and associated terms and conditions dated October 9, 2018.

2.7 Reliance, Certification, and Declaration

This report was prepared for the exclusive use of SpotOne, LLC their respective affiliates and subsidiaries, and all successors and assigns thereof. Any other use, or using this Report in a fashion in which it was not intended, is at the sole risk of the user. Reliance may only be granted upon written consent and is subject to those same terms and conditions as expressed in the proposal.



We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in 40 CFR 312.10. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the Site. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

3.0 SITE/VICINITY DESCRIPTION

3.1 Location and Legal Description

The Site is located in the City of Buffalo, New York and consists of three individual tax parcels legally described as the following Parcel Nos.:

- 127 Buffalo River SBL No. 122.13-4-2
- 189 Ganson Street SBL No. 122.13-4-1.11
- 191 Ganson Street SBL No. 122.09-2-4

3.2 Activity/Use Limitations

Benchmark is not aware of any institutional controls or activity/use limitations imposed against the referenced Site.

3.3 Site and Vicinity Description

The Site is located in a highly developed industrial area of the City of Buffalo, New York (see Figure 1). As shown on Figure 2, two structures are present on the Site. Building 1 is a truck maintenance garage, truck washing station, and office. The original western portion of Building 2 is vacant and an addition to the east is a storage area for truck parts, empty drums, and old vehicles. The Site consists of three parcels totaling approximately seven-acres and is supplied with municipal sanitary sewer, electric, natural-gas and public water. The Site is further described in the table below:

General Site Information	
Site Addresses	127 Buffalo River, 189 Ganson Street, 191 Ganson Street
Municipality, County, State	Buffalo, Erie County, New York
Current Site Use	Truck maintenance and parking, office, and storage
Fronting Streets	Ganson Street
Site Size	Approx. seven-acres (per municipal information)
Site Topography	Generally, level at grade
General Site Elevation (feet above mean sea level)	570
Nearest Water Body	Buffalo River located adjacent to the east of the Site
Improvements	Asphalt paved areas

3.4 Current Use of Property

The Site, as further described below, is currently used for truck maintenance and parking, office, and storage purposes.

Parcel ID*	Number	Street	Tax ID No.	Current Owner	Current Use
Parcel 1	127	Buffalo River	122.13-4-2	George W. Burnett, Inc.	Truck maintenance and office (Building 1)
Parcel 2	189	Ganson Street	122.13-4-1.11		Parking lot
Parcel 3	191	Ganson Street	122.09-2-4		Storage garage (Building 2)

*This ID was assigned by Benchmark in order to differentiate between the parcels within the report.

3.5 Description of Structures and Other Improvements

On-Site Building and Improvements Summary	
Building Number	Building 1 – 127 Buffalo River
Square Footage (approximate)	8,000 (per municipal information)
Building Identification/Use	Auto body repair shop and office
No. of Stories	1
Basement	None
Roof Type	Peaked
Building Envelope	Poured concrete, concrete block, and steel
Building Siding	Concrete block and aluminum
Heating System	Natural gas
Building Construction Date	1973 (per municipal information)
Utilities Provided	Natural-gas, public water, municipal sanitary sewer and electric
Building Number	Building 2 – 191 Ganson Street
Square Footage (approximate)	3,584 – original western portion/7,260 – eastern addition (per municipal information)
Building Identification/Use	Storage/Vacant
No. of Stories	1
Basement	None
Roof Type	Flat
Building Envelope	Poured concrete, concrete block, brick, steel, and wood
Building Siding	Brick and concrete block
Heating System	Natural gas
Building Construction Date	1920/1966 (per municipal information)
Utilities Provided	Natural-gas, public water, municipal sanitary sewer and electric

3.6 Adjoining Property Information

The adjacent properties were visually inspected from the Site at the time of the Site reconnaissance. The surrounding property uses include the following:

Direction	Current Use	Apparent Past Use	Comments/Concerns
North	Industrial warehouse – currently vacant	Commercial and industrial	Adjacent industrial operations could result in impacts to the environment at the Site.
South:	Vacant	Railroad and industrial	
East:	Vacant industrial and Buffalo River	Vacant, railroad, and Buffalo River	
West:	Industrial manufacturing and vacant land	Railroad and industrial	

4.0 USER PROVIDED INFORMATION

As required under 40 CFR 312, those seeking liability protection under CERCLA, for which this Report is prepared, must provide the environmental professional certain information and documentation. Benchmark requested information from Mr. Douglas Swift of SpotOne, LLC, representing the User, with responses to that inquiry as follows:

4.1 Environmental Liens

According to Mr. Swift, there are no environmental cleanup liens against the Site that are filed or recorded under federal, tribal, state or local law.

4.2 Activity Use Limitations

According to Mr. Swift, there are no engineering controls, land use restrictions or institutional controls in place, filed or recorded under federal, tribal, state or local law.

4.3 Specialized knowledge or experience

Mr. Swift does not have specialized knowledge or experience related to the Site or nearby properties.

4.4 Purchase Price

Mr. Swift indicated that the purchase price being paid for the property reasonably reflects the fair market value of the property.

4.5 Commonly Known or Reasonably Ascertainable Information

Mr. Swift is not aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases at the Site.

4.6 Obvious Indicators

Mr. Swift is not aware of any obvious indicators that point to the presence or likely presence of contamination at the property.

Appendix H includes the completed user questionnaire.

5.0 RECORDS REVIEW

5.1 Standard Environmental Records Sources

Federal and state environmental regulatory information provided by Environmental EDR was reviewed at the radii defined in 40 CFR 312.26 (see Appendix A). Any sites unplottable by EDR were also reviewed, to the extent practical based on the site name and address, to assess whether they are also present within their appropriate radii. Any relevant listings such as those for the Site or any adjacent sites are included in the following table. Refer to Appendix A for complete acronym definitions.

Site Listings

Site Database Listings	Address/Name	Summary
NY LTANKS, NY UST, NY AST, NY Spills	145 Ganson Street/George W. Burnett Inc.	Four USTs and one AST are listed as being registered at 145 Ganson Street/George W. Burnett Inc. as follows: USTs Tank 001 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 002 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 003 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. Tank 004 – 4,000-gallon diesel UST installed October 1, 1973 is listed as being "closed prior to micro conversion" in March 1991. AST Tank 1 – 10,000-gallon diesel AST installed August 1, 1995 is listed as being "in service" as of April 14, 2017. Benchmark can verify that this tank is currently operational and located on-Site, north of Building 1. The following spill incidents were identified for 145

		Ganson Street: Spill No. 8708580, dated January 4, 1988, involved petroleum contaminated soils found during tank removal activities. Contamination was reported as not significant and the spill was classified as "closed" by the NYSDEC on January 4, 1988. Spill No. 9501905, dated May 1, 1995, involved George W. Burnett Inc. using a 6,000-gallon tanker truck, which is reportedly prohibited. The owner received a permit to install a 10,000-gallon AST and the spill was classified as "closed" by the NYSDEC on May 12, 1995. There is no indication that a release occurred.
NY RGA LF, NY SWF/LF	189-191 Ganson Street/Wargo Enterprises/Wargo Enterprises at John A. Bauer	Wargo Enterprises is listed as Recovered Government Archive Solid Waste Facilities/Landfill Site from at least 2009 through at least 2012. Wargo Enterprises is also listed as a Solid Waste Facility/Landfill Site registered as a construction and demolition debris processing facility, authorized on May 6, 2009. Wargo Enterprises at John A. Bauer is listed is the FINDS database.
NY LTANKS, NY UST, NY AST, NY Spills, RCRA NonGen/NLR, FINDS, ECHO	191 Ganson Street/George W. Burnett Inc./Railroad Crossing/Ganson St/Tractor Trailer Accident/Waste Mgmt. of NY Downing Container Sv.	Two USTs and four ASTs are listed as being registered at 191 Ganson Street/George W. Burnett Inc. as follows: <u>USTs</u> Tank 1 – 4,000-gallon gasoline UST installed October 1, 1966 is listed as being "closed prior to micro conversion" in March 1991. Tank 2 – 10,000-gallon diesel UST installed May 1, 1980 is listed as being "closed – removed" on December 1, 1996. <u>ASTs</u> Tank 3 – 500-gallon unreported material AST installed January 1, 1974 is listed as being "converted to non-regulated use." A tank closed date is listed as December 1, 1991. Tank 4 – 275-gallon kerosene (#1 fuel oil) AST installed January 1, 1974 is listed as being "closed – removed" on January 1, 1995.

		Tank 5 – 275-gallon unreported material AST installed on January 1, 1974 is listed as being "closed – removed" on January 1, 1995. Tank 6 – 275-gallon unreported material AST installed January 1, 1974 is listed as being "closed – removed" on January 1, 1995. The following spill incidents were identified for 191 Ganson Street: Spill 9501488, dated May 1, 1995, involved unknown petroleum contamination at George W. Burnett Inc. found during a Phase I and Phase II investigation. The spill was classified as "inactive" by the NYSDEC on October 26, 1995. Spill No. 9611387, dated December 16, 1996, involved approximately 20-tons of diesel fuel contaminated soils found at George W. Burnett Inc. around a fill port during removal of a 10,000-gallon diesel fuel UST. Water samples and sidewall/bottom excavation soil samples were collected and analyzed. The spill was classified as "closed" by the NYSDEC on June 20, 1997. Benchmark suspects that this spill is associated with registered Tank 2 as dates and contents reported are consistent. Spills No. 1505539 and 1505541, dated August 23, 2015, involved the release of 8-gallons of diesel fuel due to a broke down tractor trailer near railroad tracks and onto the street. It was reported no fuel reached soils or waterways. Spill No. 1505539 was classified as "closed" by the NYSDEC on February 2, 2016 and Spill No. 1505541 was "closed" on August 24, 2015. Waste Management of NY Downing Container Services is listed as a RCRA non-generator of hazardous wastes with no reported violations. This property was historically listed as a large quantity generator of hazardous wastes including, but not limited to, ignitable wastes. Waste Management of NY Downing Container Services is also listed in the FINDS and ECHO databases.

Adjacent Property Listings

Adjacent Database Listings	Address/Name	Summary
NY Spills, NY SPDES, SEMS, RCRA CESQG, US AIRS, FINDS, ECHO, NJ/NY/PA Manifest	250 Ganson Street/ADM Milling Co./Industrial Site/250 Ganson Street to Pavement/Roadway/Pillsbury Co./Train Tracks 250-259 Ganson Street/ADM Plant	Numerous NYSDEC registered Spills are associated with 250 Ganson Street. All spills are classified as "inactive" or "closed" by the NYSDEC. SPDES permit no. NYR00E008 is associated with ADM Milling Co. to discharge to Lake Erie. ADM Milling Co. is listed in the Superfund Enterprise Management System. ADM Milling Co. is also listed as a RCRA conditionally exempt small quantity generator of hazardous wastes with no reported violations. Historic generator at this property include The Pillsbury Co. Hazardous wastes include, but are not limited to PCBs. 250 Ganson Street is also regulated by the US AIRS database as part of the US EPA Risk Management Plan for companies that handle, manufacture, use, or store flammable or toxic substances. The property is also listed in the FINDS and ECHO databases. NJ, NY report off-site disposal by ADM Milling Co. of hazardous wastes including, but no limited to, ignitable wastes, cadmium, chromium, lead. PA Manifests report off-site disposal by The Pillsbury Co. of hazardous wastes including, but not limited to, ignitable wastes.
NY Spills	95 Ganson Street/Construction Site	Spill No. 1800067, dated April 3, 2018, involved two-gallons of hydraulic oil to gravel surface. The spill was cleaned and classified as "closed" by the NYSDEC on April 4, 2018.
NY Spills, Abandoned Mines, RCRA-LQG, FINDS, ECHO, NY UST, NY Manifest	201 Ganson Street/Buffalo Industrial Diving/Metso (Nordberg) No. SN20360448/USEPA Buffalo River Dredging Notification of PCB Activity	Spill No. 1075467, dated December 31, 2001, involved 50-gallons of diesel fuel released to the Buffalo River from a docked boat. The spill was classified as "closed" by the NYSDEC on January 12, 2002. Spill No. 0175122, dated May 31, 2001, involved petroleum contamination environmental investigations. Monitoring wells installed during the investigation were test on April 17, 2003 and continued to show slight exceedances of

		groundwater standards. Therefore, the property was classified as "inactive" by the NYSDEC on April 17, 2003. Metso (Nordberg) No. SN20360448 is listed as an abandoned surface mine as of April 17, 2012. USEPA Buffalo River Dredging Notification of PCB Activity is listed as a RCRA large quantity generator of hazardous wastes with no reported violations. Historic generators for the property include Cowper Siegfried Construction. Hazardous wastes include, but are not limited to, ignitable wastes, spent non-halogenated solvents, and spent halogenated solvents. This property is also listed in the FINDS and ECHO database. NY Manifest database indicates off-site disposal of 16,738 kg of PCB wastes transported in dump trucks to a landfill. Two USTs are listed as being registered at 201 Ganson Street/Cowper Siegfried Co., Inc. as follows: Tank 001 – 8,000-gallon diesel UST installed August 1, 1973 is listed as "closed – removed" on May 1, 1989. Tank 002 – 4,000-gallon gasoline UST installed August 1, 1973 is listed as being "closed – removed" on May 1, 1989.

Nearby Properties

Additional regulatory listings were identified for nearby properties. Brief summaries of the relevant listings are provided in the table below.

Nearby Database Listings	Address/Name	Summary
NY Brownfields, NY SHWS	Multiple properties	Nearby properties at 399 Ohio Street, 441 Ohio Street, 300 Ohio Street, 31 South Street, 724 Ohio Street, 901 Fuhrmann Boulevard, and 300 Scott Street are listed as either NY Brownfield or State Hazardous Waste Sites. However, all properties are located over one-eighth mile from the Site and there is no information indicating an environmental concern at the Site from nearby properties.
NY Spills and LTANKS	Multiple properties	The remaining spill incidents identified within the search radii for nearby properties are classified as

		"inactive" or "closed" by the NYSDEC.
Numerous Database Listings	Multiple properties	The numerous remaining regulatory listings were reviewed by Benchmark and none of the information suggested a specific environmental concern at the Site; see below for additional information.

In addition to the nearby properties listed above, several additional sites located proximate to the Site are listed on one or more environmental databases. However, based on Benchmark's review, each of these additional sites falls in one or more of the following categories:

- It is listed on databases that indicate a potential for, but not an actual documented current or historical release (e.g., RCRA small quantity generator or large quantity generator; registered chemical bulk storage or petroleum bulk storage sites). As such, these sites are not considered to pose a REC at the Site due to absence of a documented release.
- It is located greater than one-eighth mile from the Site and is not considered a REC based on the distance from the Site.
- It is present at a location that is not expected to pose potential for impact on the Site due to topography and likely groundwater flow direction and is not considered a REC based on unlikelihood for impacts associated with migration of contaminants onto the Site.

The discussion included above regarding adjacent and surrounding properties is based on information supplied to Benchmark as well as observations of nearby properties at the time of the Site reconnaissance. Further study would be required to positively confirm whether the Site has been impacted by nearby properties. It is also important to note that the environmental history and status of nearby properties, real or perceived, can affect the valuation of the target property.

5.2 Additional Environmental Record Sources

To augment the information provided by EDR, a FOIA request was forwarded to the NYSDEC on October 22, 2018 for information concerning the Site (see Appendix B). The information obtained from the FOIA response appeared generally consistent with the Site regulatory listings summarized above.

Benchmark also completed a search on the NYSDEC website of readily available records for the Site, including an Environmental Site Database Search for spills, remedial sites and bulk storage facilities. A search of the USEPA Envirofacts website was also completed. The information obtained from the on-line research and the NYSDEC FOIA response appeared generally consistent with the Site regulatory listings summarized above.

5.3 Physical Setting Sources

Figure 1 shows the Site on an undated USGS Topographic Map, Buffalo SE Quadrangle. The Site is located in a highly developed industrial area. The Site appears to be developed with the presumed former railroad yards. The Site is located approximately 570 feet above mean sea level.

Groundwater flow is likely to the east or west toward the Buffalo River or consistent with topography in the area of the Site. Local groundwater flow, however, may be influenced by subsurface features, such as excavations, utilities, and localized fill-conditions.

5.4 Historical Use

The historical use of the Site has been researched through review of previous studies, historic Sanborn maps, historic aerial photographs, municipal records, historic topographic maps, and/or other reasonably obtainable documents. The following sections summarize Benchmark's research.

5.4.1 Historic Aerial Photographs

Historical aerial photographs serve to reveal former topography, buildings, structures and man-made works such as canals, lagoons and railroads that may have been altered or may no longer be in existence. Historical aerial photographs were obtained online through http://historicaerials.com/ for additional historical information relative to the Site and surrounding area. It should be noted that visual observations were limited on some aerial photographs due to poor quality.

YEAR	OBSERVATIONS
1959, 1963	
Site	The Site appears to be developed with former industrial buildings and associated

	parking areas in the northwest portion. The original portion of Building 2 appears to be in its current configuration. The southeast portion of the Site appears to contain a disturbance likely associated with cleared land and/or piled materials. Apparent railroad tracks also appear on-Site.
North	Industrial. Several large buildings adjacent to the northwest portion of the Site with a boat dock are apparent.
South	Vacant
East	A large industrial building is present to the northeast. The remainder of the Site borders the Buffalo River
West	Industrial. Several large buildings and railroad tracks are apparent.
1966	
Site	Four buildings in the northwest portion of the Site appear to be removed. Building 1 and the original portion of Building 2 appear to be in their current configuration. The remainder of the Site is consistent with above.
North	Industrial. The dock appears to be removed and is now cleared land.
South	Consistent with above.
East	Consistent with above.
West	Consistent with above.
1995	
Site	The Site appears to be developed with the existing buildings in their current configurations. Numerous apparent parked vehicles and/or equipment/materials are scattered throughout the Site.
North	Industrial. One new building appears to the east of previously described buildings.
South	Consistent with above.
East	The building adjacent to the northeast portion of the Site appears to be removed and is now vacant land.
West	Consistent with above.
2002-2013	
Site	The existing buildings appear in their current configuration. Apparent parked tractor trailers appear across the Site.
North	Consistent with above.
South	A roadway appears to be installed for truck turnarounds.
East	Consistent with above.
West	A southern portion of the industrial building previously described appears to be removed.

5.4.2 Historical Sanborn Maps

Sanborn maps serve to reveal former buildings, building uses, and man-made works such as canals, lagoons and railroads that may have been altered or may no longer be in existence. Historic addresses identified for the Site were identified as 157, 161, and 169 Ganson Street. The following table summarizes the maps. Appendix C includes copies of the Sanborn Maps provided by EDR and the Buffalo and Erie County Public Library website.

YEAR	OBSERVATIONS
1889	
Site	The Site appears to be developed with various structures. Specifically, a large lumber shed (identified as formerly Burt and Mead's Planing Mill) is located in the northern portion of the Site. Several residential and one unidentified commercial structure are located south of the lumber shed, along Ganson Street. A boat slip is located on the central portion of the Site east of the residential structures. On the southern portion of the Site, several railroad tracks are shown with an iron ore yard and repair shop. Five unknown circular structures, possible derricks, appear on the eastern portion of the Site east of the iron or building.
North	Commercial
South	Railroad tacks
East	Vacant and Buffalo River
West	Railroad tracks and associated buildings
1899	
Site	Several residential structures remain along Ganson Street. The remainder of the Site is developed with railroad tracks. Ore docks and apparent derricks are shown in the southeast portion of the Site.
North	Industrial machine shop is shown.
South	Industrial ore docks are shown.
East	The Erie Railroad Freight House is shown to the northeast and the Buffalo River is shown to the southeast.
West	Consistent with above. Northern Steamship Co. Freight House is identified.
1925	
Site	Three structures are shown along Ganson Street including a storefront, a residential structure, and a sheet metal shop. The remainder of the Site consists primarily of railroad tracks. One gasoline tank is shown in the central portion of the Sit to the east of railroad tracks (east of the former sheet metal shop). Numerous structures are shown in the northwest corner of the Site at 191-199 Ganson Street including an auto house, storage, tin shop, pipe shop, and paint shop.
North	Vacant
South	Unmapped
East	Consistent with above.
West	Consistent with above. The Island Warehouse Corporation is identified.
1951	
Site	Railroad track and the gasoline tank remain on-Site. In addition, two structures remain along Ganson Street including a residential building and restaurant/storefront. The buildings in the northwest corner of the Site remain consistent with above.
North	Consistent with above.
South	Consistent with above.
East	Consistent with above.
West	Consistent with above. The Pillsbury Flour Mills Company is now identified.

1981, 1986	
Site	The existing buildings on-Site appear in their current configuration. Building 1 is identified as being used for transportation and Building 2 is identified as being used by Downing Container Service as an office and paper container factory/facility. One railroad track remains with an Erie Railroad Weighing and Inspection Station.
North	Industrial. A machine shop is shown at 209-215 Ganson Street
South	Unmapped
East	Consistent with above. The building to the northeast is identified as dilapidated and open.
West	Consistent with above.

5.4.3 Historical City Directories

Historic city directories, dated between 1925 and 2014, were reviewed (generally in five-year intervals) through an EDR database search for additional information regarding the Site. Listings identified as **Bold** represent a potential environmental concern. Appendix D includes a copy of the abstract report.

Year	Address (Ganson Street)	Listing(s)
1925	189	Earl R. Roberts Restaurant
1930	161	Individual tenant
	189	Earl Roberts soft drinks
	191	191-301 Buffalo Dry Dock Co.
1935	**157**	**Great Lakes Transit Corp. Tin Shop**
	161	Individual tenant
	189	Earl R. Roberts Restaurant
	191	Buffalo Dry Dock Co.
1940	157	Vacant
	161	Individual tenant
	189	Earl R. Roberts Restaurant
	191	**The American Shipbuilding Co.**
1946	161	Individual tenant
	189	Earl R. Roberts Restaurant
	191	**The American Shipbuilding Co.**
1950	161	Individual tenant
	189	Earl R. Roberts Restaurant
	191	**The American Shipbuilding Co.,** Buffalo Dry Docks Yards
1955	161	Individual tenant
	189	Earl R. Roberts Restaurant
	191	**The American Shipbuilding Co.,** Buffalo Dry Docks Yards
1960	189	Earl R. Roberts Restaurant
	191	**The American Shipbuilding Co.,** Buffalo Dry Docks Yards
1964	189	Earl R. Roberts Restaurant
1970	189	Earl R. Roberts Restaurant
	191	**Downing Container Service Inc.**
1975	**145**	**N&K Cartage Co. Inc. trucking**

	189	Roberts Restaurant
	191	**Downing Container Service Inc.**
1980	**145**	**Lake Erie Transportation Co. Inc.**
	191	**Downing Container Service Inc., rubbish removal**
1985	**145**	**GW Burnett Trucking, Lake Erie Transportation Co. Inc.**
	191	**Downing Container Service Inc., rubbish removal**
1992	**145**	**Lake Erie Transportation Co. Inc.**
	157	**Roy Track Inc. railroad construction**
	191	**Downing Container Service Inc., rubbish removal**
1998	**145**	**GW Burnett Trucking**
	157	**Roy Track Inc. heavy construction**
2001	**145**	**GW Burnett Local Trucking**
	157	**Roy Track Inc. heavy construction**
	191	**Safeway Steel Products scaffolding**
2008	**145**	**Lake Erie Transportation Co. Inc.**
2010	**145**	**B&B Disposal Inc., George W. Burnett Inc.**
2014	**145**	**B&B Disposal Inc., George W. Burnett Inc.**

5.4.4 Historical Topographic Maps

Historical topographic maps available on-line were reviewed for additional information regarding the Site.

YEAR	OBSERVATIONS
1894-1947	
Site	The Site appears to be developed with railroad tracks running along to western and eastern property boundaries as well as within the northern portion of the Site. Three apparent buildings are shown in the central portion of the Site.
1950-1967	
Site	Most of the Site appears to be developed with railroad tracks. The previous three buildings are no longer shown. Two apparent building are shown in the northwest portion of the Site with the western-most building changing configuration from 1950 to 1967.
2013-2016	
Site	Due to extensive development in the area of the Site individual structures are not shown.

5.4.5 Municipal Records

Records readily available at the City of Buffalo municipal offices (Assessor, Building and Fire Departments) as well as records available online from the Erie County GIS were reviewed for additional information relative to the Site. Benchmark also researched historic addresses identified for the Site through review of Sanborn maps which includes 157, 161, and 169 Ganson Street. Note that a FOIL was submitted to the City of Buffalo as required

to access their records. The following summarizes municipal records provided to Benchmark at the time of this assessment; copies of the pertinent records are included in Appendix E.

- The Site measures approximately seven-acres and is currently owned by George W. Burnett, Inc and includes the following Tax ID Nos.:
    - 127 Buffalo River – 122.13-4-2
    - 189 Ganson Street – 122.13-4-1.11
    - 191 Ganson Street – 122.09-2-4
- Past owners were identified as John A. Bauer, Francis J. Downing, General Portland, J. Lloyd, Earl Roberts, American Shipbuilding Co., Robert Downing, Downing Container Services, Francis Downing Construction Co., Erie R.R. Co., Buffalo Dry Dock Co., Roberts Tavern, Lake Erie Transportation, Carlson Truck Service, and M&K Cartage Co.
- Building 1, constructed in 1973, measures 8,000 square feet. Building 2, constructed in 1920, measures 3,584 square feet with an addition, constructed in 1966, measuring 7,260 square feet.
- The Site is supplied with natural-gas, municipal sanitary sewer, public water and electric.
- The following records associated with environmental concerns appear to involve the Site addresses.
    - 191 Ganson Street:

      o 1918 – one permit for Buffalo Dry Dock Co. to erect a two-story machine shop. The location of the machine shop is unknown based on the municipal information.

      o 1947 – a hand written note indicates installation of two fuel oil tanks, presumed by Benchmark to be USTs, installed proximate a two-story building where the oil would be pumped to a rooftop reservoir and used for interior furnaces. The location of the tanks and building are unknown based on municipal information.

      o 1965 – Public Works applications to allow Morris & Reimann Wreckers, Inc. to dump stone and clay to bring Site to grade.

      o 1966 – two permits and fire prevention records for Downing Container indicating the following information:

        - June 13 – erect and use a one-story truck garage
        - September 29 – place and use two 4,000-gallon gasoline USTs and one 4,000-gallon diesel fuel UST. The location of the USTs are unknown based

on the municipal record; however, Lt. R.G. Knox noted that two of these USTs were removed on May 5, 1986 which is consistent with the 1973 fire prevention record below indicating the location of USTs northeast of the existing Building 2.

- 1973 – fire prevention records for Downing Container Service to install one 4,000-gallon steel diesel fuel UST. It is noted on the record by Lt. R.G. Knox that the UST was removed May 5, 1986. An additional sketch by Lt. Knox indicates removal of three USTs with one UST to remain. Record indicates the location of the USTs northeast of the existing Building 2.
- 1974 – permit for Downing Container Service to install and use one 4,000-gallon steel UST for private diesel fuel storage.
- 1980 – permit and fire prevention records for Downing Container Service to place and use one 10,000-gallon steel diesel fuel UST. Fire prevention records include a sketch showing the tank southeast of Building 2.
- 1980 – Sketches from the fire prevention department depict three 4,000-gallon USTs and one 4,000-gallon UST to be installed with two pumps north of the existing garage of Building 2. As described above, Lt. R.G. Knox noted on a 1973 fire prevention record that three of the four USTs were removed in 1986.
- 1984 – application for Downing Container Service Inc. to conduct restricted burning of a 10,000-gallon gasoline tank. A sketch provided indicates the proposed burning site east of the Downing Container Service building.
- 1984, 1985, 1986, 1987 – fire prevention inspection records advising Downing Container that outside storage tanks (waste oil and kerosene) to be bunkered and protected by bollards.
- 1987 – fire prevention records indicating removal of one 4,000-gallon gasoline UST and associated vent at Downing Container Service. Elmwood Tank & Piping Corp. document indicates the contract to clean, gas free and legally dispose of the UST per NYDEC regulations. The location of the UST is unknown based on the municipal information.

- 145 Ganson Street:
  - 1949 – fire prevention records indicating approval of an application to install one 3,000-gallon gasoline UST for Carlson Truck Service Inc. The location of the UST is unknown based on the municipal information.
  - 1960 – fire prevention records indicating installation of one new 3,000-gallon and one existing 1,000-gallon diesel fuel USTs for Carlson Truck Service. Additional information indicates removal and replacement of a

leaking 3,000-gallon UST. A sketch depicts the location of the USTs west of the existing Building 1.

- 1966 – fire prevention records indicating application, installation and survey for one 4,000-gallon gasoline UST for Carlson Trucking. A sketch depicting the tank locations proximate the existing garage building west of Building 1 is provided. An additional existing 3,000-gallon UST is also shown which is consistent with 1949 municipal information.
- 1972 – fire prevention records indicating approval of an application to install three 4,000-gallon USTs and one 2,000-gallon gasoline UST for M&K Cartage. A sketch depicting the tank locations south of the existing Building 1 office space is provided.
- 1988 – fire prevention records indicating removal of three 4,000-gallon USTs and one 2,000-gallon diesel fuel UST and associated vents at Lake Erie Transportation. The location of the USTs are unknown based on the municipal information.
- 1995 – a permit application by George W. Burnett, Inc. to install a 10,000-gallon aboveground diesel fuel storage tank. The tank is shown to be located north of the existing building and tank specifications are provided.

The City of Building Inspector would not provide Benchmark with an interview relative to the Site. However, Mr. Jeremy Martz, City Assessor and Cpt. Ron Barrett, Fire Prevention Department were interviewed. Neither individual had any prior knowledge of environmental concerns associated with the Site.

5.4.6 Site History Provided by Site Contact

According to the site contact (owner's representative), the Site is currently and has historically been used for truck maintenance purposes since at least 1978 when G.W. Burnett Inc. occupied the Site. The Site had previously been used as a lime pile for nearby concrete manufacturing in at least the mid-1960s. Building 1 has been used for truck maintenance. The western portion of Building 2 has been vacant since at least 1978 while the eastern portion has been used for minor maintenance operations but is currently a storage area. The Site contact also indicated that all USTs, associated piping, and pumps have been removed from the Site and the NYSDEC approved all removal activities.

Section 7.1 includes additional information provided by the Site contact.

5.4.7 Abstract of Title

Abstract of Title information was not provided to Benchmark.

5.4.8 Previous Assessments

The following previous studies were provided to Benchmark:

"Phase II Environmental Site Assessment," completed by AFI Environmental, for Waste Management of New York dated December 28, 1994. The study is addressed for 191 Ganson Street; however, it appears to mainly involve the 189 Ganson Street Parcel. The following is a summary of the previous report:

During the environmental investigation, the Site being evaluated was identified as 4.78-acres with one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas and was owned by Downing Container Services, Inc.

A previous Phase I Environmental Site Assessment, conducted by AFI in 1993, was referenced within the Phase II text. AFI's Phase I reportedly identified the following RECs:

- Numerous petroleum stained areas in both the garage areas and staging/parking areas;
- Soils in and around former USTs were never sampled;
- Fill materials utilized to fill dry docks north of the Site were shown to contain elevated VOCs, PCBs, and metals. Groundwater in this area has also been shown to contain elevated acetone, methylene chloride, and metals;
- Potential impacts on-Site from the Buffalo River;
- Potential discharges of automotive related chemicals into the combined municipal sewer system;
- Historical uses of the property for industrial purposes;
- Potential impacts to soils and stormwater proximate to truck staging areas.

To assess the RECs detailed above, AFI installed five monitoring wells, completed ten soil borings, and collected three sediment samples. Monitoring wells were installed to approximately 17 fbgs with 10-foot screens to allow infiltration of groundwater, which was

reportedly measured at depths ranging between 2.88 and 8.02 fbgs. Soil boring samples were taken from depths ranging from 0.5 to 1 fbgs. Sediment samples were collected from material from the bottom of on-Site catch basins. In total, two soil samples from 0.5 to 1 fbgs, one sediment sample and five groundwater samples were collected for laboratory analysis. Elevated VOCs and SVOCs were detected in sample areas proximate to former UST and fueling/waste container locations. One sludge/sediment sample taken from a surface runoff inlet indicated elevated levels of VOCs, particularly acetone (39,000 ppb) and toluene (62,400 ppb). PCBs were detected at all sample locations and AFI determined the likely cause to be a result of fill brought on-Site prior to the Downing Container Service's existence or on-Site activity of liquid petroleum fractions within the soil matrix allowing PCBs to become mobile. All groundwater samples were determined to be clean and contain levels of contaminants below NYSDEC drinking water standards.

Based on AFI's Phase II investigation, they recommended a more extensive soil/sediment investigation to determine concentrations, distribution (horizontal and vertical), and source of petroleum and PCB-1260 constituents within the soil matrix. Once the source boundaries of contamination are established, AFI recommended implementation of a corrective action plan based on effectiveness, potential impacts to human health and the environment, cost, compatibility with the current commercial nature of the Site, and NYSDEC recommendations.

"Remedial Action Plan Soil Investigation Report, Downing Container, 191 Ganson Street, Buffalo, New York, completed by AFI Environmental, for Waste Management, dated May 8, 1995. The purpose of the work was to further investigate the areal extent and composition of impact constituents to identify the cost to mitigate existing soil/sediment contamination at the Waste Management facility. Additional investigation activities included five additional soil samples from three distinct areas of concern identified by AFI as a former UST Area (Area 1), a former roll off dumpster staging area (Area 2), and the gas island/storm sewer inlet area (Area 3). Five soil samples from 6" to 18" were collected and homogenized and analyzed for TCLP VOCs and TCLP SVOCs. Laboratory analytical results revealed an exceedance of naphthalene at one location at a concentration exceeding applicable regulatory criteria. AFI recommended excavation activities on-Site.

"Soil and Sediment Remediation Report, Downing Container, 191 Ganson Street, Buffalo, New York," completed by AFI Environmental, for Waste Management of New York, dated September 28, 1995. This report is related to Spill No. 9501488 assigned to 191 Ganson Street on May 1, 1995. The purpose of the report is to document the petroleum-impacted soil and sediment encountered at the Downing Container facility (a storage yard and repair shop for WM/Downing Container garbage pickup and roll-off operations. The work included:

- Removal of soil (identified as a 20' x 20' x 2.5' area) from a former UST area.
- Excavation of soil (identified as a 25' x 25' by 18" area) from a roll off staging area where toluene contaminated soils were reportedly awaiting NYSDEC approval for approval.
- Excavation of staining in parking lot areas near pump islands and vehicle parking areas.
- Sediment removal and cleaning of storm drains.
- Backfilling of excavation areas with No. 2 crusher.
- Post excavation soil sampling.

  It appears that soil/sediment samples were analyzed for PAHs, TCLP VOCs and PCBs. AFI indicated that isolated soil and sediment impacts (apparently for SVOCs, PCBs and metals) across the Site and within the storm water drainage system. AFI further indicated that no groundwater impacts were identified, and post excavation composite samples were below background levels or lower.

"Remedial Action Plan, Downing Container, 191 Ganson Street, Buffalo, New York," completed by AFI Environmental, for Waste Management, dated February 1995. The report detailed AFI's plan to complete additional investigation activities in Areas 1 through 3.

An October 30, 1995 letter from the NYSDEC to Waste Management indicates that the Department reviewed the analytical results from post excavation soil samples and they are not recommending further work since the results were "low levels."

A copy of the previous study is included in Appendix F.

5.4.9 Summary of Historic Uses

Approximate Years	Reported or Suspected Use	Owner/Occupant
At least 1889 through current	Current operations include truck maintenance, a truck washing station, office space and storage for truck parts, empty drums, and old vehicles. Historic operations included a mix of industrial, commercial, and residential uses. Sanborn maps indicate various structures and operations throughout these years including lumber sheds, iron ore yards, machine shops, tin shops, railroads, commercial buildings, and restaurants. Various railroad tracks also appeared on-Site. In addition, trucking, container, and transportation, and construction companies were on-Site. Previous studies indicate that Site was historically used as a storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, roll off and rental operations. Multiple residential structures were formerly present along Ganson Street. Municipal records and regulatory records indicate installation of at least 14 USTs between 1949 and 1980, and removal of at least eight USTs between 1986 and 1988. The exact locations of several USTs were not identified in historical records.	Current owner: George W. Burnett Inc. Past owners/occupants include J. Lloyd, Earl Roberts, American Shipbuilding Co., Buffalo Dry Dock Co., Great Lakes Transit Corp., Earl Roberts, Waste Management/Downing Container Service Inc., N&K Cartage Co. Inc., Lake Erie Transportation Co. Inc., Roy Track Inc., and Carlson Truck Service.

5.5 Environmental Liens

Benchmark is not aware of any formal environmental liens, enforcement action, civil, judicial or administrative enforcement cases in connection with the Site.

6.0 SITE RECONNAISSANCE

6.1 Methodology and Limiting Conditions

A visual review of the Site was completed to document Site conditions and identify potential RECs. The presence of parked vehicles and stored materials/equipment hindered observations of ground surfaces at the time of the Site reconnaissance.

6.2 General Site Setting

Mr. Chad Schuster of Benchmark performed the Site reconnaissance on October 25, 2018. Benchmark was accompanied by Mr. Eric Bauer of G.W. Burnett, Inc. reportedly associated with the Site for approximately 35 years.

Appendix G includes photographs taken during the Site reconnaissance.

6.3 Site Visit Findings

6.3.1 Current On-Site Operations

Two structures are present on the Site. Building 1 is occupied by a truck maintenance garage and office space. Additionally, a truck washing station is located adjacent to the east side of Building 1. The western portion of Building 2 is currently vacant, and an eastern addition is currently used as storage for truck parts, empty drums, and old vehicles.

6.3.2 Storage Tanks

One 10,000-gallon #2 diesel fuel oil AST is located north of Building 1. The AST appears to be in good condition and is located within secondary containment. No concerns (staining, odors, etc.) were noted proximate to the AST within the secondary containment.

A used oil AST is located within Building 1. The tank is used for collection of oil consumed for an overhead furnace within the maintenance area of Building 1. No concerns (staining, odors, etc.) were noted proximate the tank or furnace areas.

An additional 200-gallon AST is located within Building 1 labeled Super-D XA Diesel Engine Oil with Liquid Titanium SAE 15W-40. No concerns (staining, odors, etc.) were noted proximate the tank.

Benchmark is aware of the extensive tank history associated with the Site. Concrete ground surface areas were observed by Benchmark to the south and northeast of Building 2, potentially indicative of former UST and/or pump island areas. Benchmark was informed by Mr. Bauer that all USTs, associated piping, and pumps were removed per NYSDEC standards. Mr. Bauer also verified the location of a former UST field, which was removed, south of Building 1. Other than concrete ground surfaces, no additional evidence (vent pipes, brackets, etc.) of remaining USTs was observed at the time of the Site reconnaissance.

6.3.3 Hazardous or Regulated Materials

General cleaning/maintenance materials are stored and utilized on-Site. No concerns (staining, odors, etc.) were noted proximate to these materials at the time of the site visit.

Automotive-related fluids including oils, brake fluid and antifreeze were noted in Building 1 in drums of 55-gallons or less and/or containers of five gallons or less. Additional containers of diesel exhaust fluid, synthetic lubricant, specialized lubricant, paints, hydraulic oil, transmission fluid, compressor lubricant, power steering fluid, concrete remover and cleaner, degreaser, soap, and aluminum cleaner were also noted.

Benchmark was informed by Mr. Bauer that all waste oils are burned on-Site, and the procedure is regularly monitored by the Buffalo Fire Department.

A 55-gallon drum of waste oil was observed off-Site adjacent to the northeast corner of the Site. The drum was tipped on its side; however, no concerns (staining, stressed vegetations, odors, etc.) were observed proximate to the drum and within the Site property boundary.

6.3.4 Solid, Hazardous or Regulated Wastes

General refuse generated on-Site is stored in dumpsters that are picked up regularly by Allied Waste Services.

Hazardous/regulated wastes are generated in connection with automotive repair operations at Building 1. According to the Site contact, wastes generated on-site include used motor oils. The Site contact indicated that the waste oils are burned on-Site and regularly monitored by the Buffalo Fire Department.

Three 30-gallon drums of Transoil 50, Specialized Lubricant, and 75W-90 motor oil were observed within the maintenance area of Building 1. No concerns (staining, odors, etc.) were noted proximate to these drums.

A moveable floor pan was observed proximate the previously discussed used oil tank within Building 1. The pan was filled with oil; however, no concerns (staining, etc.) was noted proximate the pan on the ground surface.

Approximately 25 new and used tires are stored within Building 1 on racks in an upright position. Additionally, multiple used tires are stored within Building 2. No concerns (staining, odors, etc.) were noted proximate any tires in both Buildings.

6.3.5 Miscellaneous Debris/Stored Materials

Numerous truck parts are stored within Building 1 and Building 2. All unused parts are stored on shelving and no concerns (staining, odors, etc.) were noted proximate to the stored parts.

Miscellaneous debris such as old sinks, rubber tracks, shelving, and tire rims were observed outside the northern portion of Building 1. No concerns (staining, odors, etc.) were noted proximate this debris.

Two small piles of stone fill material were observed in the central portion of the site. An additional pile of miscellaneous fill material (i.e. stone, brick, etc.) along with scattered general refuse (i.e. lumber) was observed in the northeastern portion of the Site. Both piles were located along the eastern edge of the Site. No concerns (staining, odors, etc.) were noted proximate to the piled material.

6.3.6 Fill

Benchmark observed visible evidence of fill activity at the time of the Site reconnaissance. Unpaved, grass areas around the northern portion of the Site contained, what appeared to be brick material and other non-native soil materials. In addition, Benchmark is aware of former buildings at the Site thus it is possible that fill materials from unknown origins were brought to the Site to bring former building areas to grade.

6.3.7 Ground Surface Disturbances

Multiple unknown asphalt disturbances were noted throughout the parking lot area of the Site, mostly in high traffic areas. Benchmark suspects these disturbances to be associated with heavy traffic areas; however, due to known former building on-Site, these disturbances could be related to settling of backfill material in former building areas.

6.3.8 Suspected Former Pump Islands and/or UST Fields

Concrete ground surfaces were observed to the south and northeast of Building 2. Benchmark was informed by the Site contact that these concrete areas were locations of former pump island and UST's fields.

6.3.9 Staining/Spillage and Pools of Liquid

Black staining was observed on the concrete ground surface in two areas of Building 2. Minor staining was noted proximate a concrete joint in the eastern portion of Building 2. Additional black staining was observed in the central portion of Building 2. Benchmark was informed by the Site contact that the cause of this staining was from maintenance to the Site owner's personal vehicle. No cracks were observed to the concrete floor surface proximate this stained area.

6.3.10 Stressed and/or Dead Vegetation

None observed.

6.3.11 Odors

None observed.

6.3.12 Unidentified Substance Containers

Several 55-gallon drums within Building 2 were unable to be identified. The Site contact informed Benchmark that all drums within Building 2 were empty. However, Benchmark could not visually inspect the drums and it Is possible residual liquids remain in these drums.

6.3.13 Unknown Pipe

An unknown pipe was observed within the northeast corner of Building 1; such was observed protruding from the concrete ground surface. The pipe is approximately 1.5-inches in diameter and painted metal. It extends through the eastern wall of Building 1 and is disconnected at the exterior approximately four-feet in height. A threaded 90-degree connection is located at the end portion of the pipe. The Site contact could not verify the use of the pipe.

6.3.14 Heating/Cooling

Natural-gas fired forced air heating/cooling systems are used on-Site within the office area of Building 1 and throughout Building 2. An overhead oil furnace is located within the maintenance are of Building 1. No concerns (staining, odors, etc.) were noted proximate the furnace.

6.3.15 Wastewaters

The Site is currently connected to the municipal sanitary sewer system.

6.3.16 Potable Water Supply/Wells

The Site is serviced by the municipal water supply.

6.3.17 Drains and Sumps

A trench drain running in a west-east direction was observed by Benchmark within the maintenance area of Building 1. An additional trench drain is located in the eastern portion of Building 1 running in a south-north direction, which is utilized as a truck washing area. The Site contact informed Benchmark that both drains are connected and run to an oil-water separator located north of Building 1. The oil-water separator then runs west and connects to the Buffalo Sewer Authority municipal combined sewer system located on Ganson Street. No concerns (staining, odors, etc.) were noted proximate the drains. Benchmark was unable to observe to contents of the drains.

A circular floor drain is located within the eastern portion of Building 2. Benchmark was unable to observe the contents within the drain. However, no concerns (staining, odors, etc.) were noted proximate the drain.

No sumps were observed during the Site reconnaissance.

Storm drains were observed in the parking lot area in the western portion of the Site. An additional storm drain is located east of Building 1 within an outdoor truck washing area. The Site contact informed Benchmark that all storm drainage collected within catch basins discharges into the Buffalo Sewer Authority municipal combined sewer system located on Ganson Street.

Benchmark observed differences in Site topography at the time of the Site reconnaissance which indicated some of the site stormwater is conveyed east as overland flow directly toward the Buffalo River.

6.3.18 Air Emissions

No process exhaust systems were noted on-site at the time of the Site inspection.

6.3.19 Pits, Ponds and Lagoons

None observed.

6.3.20 Septic System

None observed.

6.3.21 PCBs

Utility-owned pole-mounted transformers were noted along the property border on Ganson Street. No concerns (staining, odors, etc.) were noted proximate to the transformers at the time of the Site visit.

6.3.22 Previous Intrusive Work

Four existing monitoring wells, installed as part of previous subsurface investigations completed by others, were noted in the northern portion of the Site along the property boundary.

6.3.23 Adjacent Property Use

Adjacent properties are currently utilized for industrial purposes, including manufacturing and warehousing operations. No concerns (staining, odors, obvious spills, etc.) were noted on-Site in connection with current adjacent operations.

6.4 Summary of Site Reconnaissance Potential Concerns

The following potential environmental concerns were identified at the time of the Site reconnaissance:

- Building 1 is currently used as an automotive repair operation with associated storage and use of hazardous/regulated materials.
- Automotive-related fluids including oils, brake fluid and antifreeze were noted in Building 1 in drums of 55-gallons or less and/or containers of five gallons or less. Additional containers of diesel exhaust fluid, synthetic lubricant, specialized lubricant, paints, hydraulic oil, transmission fluid, compressor lubricant, power steering fluid, concrete remover and cleaner, degreaser, soap, and aluminum cleaner were also noted.
- A 55-gallon drum of waste oil was observed off-Site adjacent to the northeast corner of the Site. The drum was tipped on its side; however, no concerns (staining, stressed vegetations, odors, etc.) were observed proximate to the drum and within the Site property boundary.
- Hazardous/regulated wastes are generated in connection with automotive repair operations at Building 1. According to the Site contact, wastes generated on-site include used motor oils.
- Benchmark was informed by the site contact that all waste oils are burned on-Site within a waste oil burner.
- One 10,000-gallon diesel fuel AST is located north of Building 1 within secondary containment.
- Concrete ground surface throughout the Site were observed, particularly south and northeast of Building 2. These concrete areas are reportedly indicative of former UST fields and pump island areas. The Site contact verified these areas to be locations of previously removed USTs and pumps.
- An unknown pipe, approximately 1.5-inches in diameter, is protruding vertically from the ground surface inside the northeast corner of Building 1 and exits the exterior wall approximately four-feet above the ground. It is disconnected outside the building. The Site contact did not know the origin or use of the unknown pipe.

- A used oil AST is located within Building 1 which is used for collection of oil consumed by an overhead furnace/waste oil burner located in the maintenance area. Additionally, a moveable pan filled with oil was located proximate the tank.
- A 200-gallon AST is located within Building 1. It is labeled Super-D XA Diesel Engine Oil with Liquid Titanium SAE 15W-40.
- Trench style floor drains are located throughout Building 1 within the maintenance area and truck wash area.
- The Site contact indicated the floor drains outlet to an oil-water separator located north of Building 1 prior to discharge to the Buffalo Sewer Authority combined sewer system located on Ganson Street.
- Multiple 55-gallon drums of unknown materials are located within Building 2. The Site contact indicated these drums to be empty; however, Benchmark could not visually confirm.
- Black staining, believed to be waste oil, was observed on the ground surface within Building 2. The Site contact indicated the staining to be a result of the Site owner performing general maintenance to a personal vehicle.
- Miscellaneous stored materials including numerous truck parts and tires are stored within Building 1 and Building 2 on shelving and concrete ground surfaces. Additional miscellaneous debris is located on the north exterior of Building 1.
- Two small pile of stone fill material and one pile of miscellaneous fill material are located along the eastern portion of the Site.
- Based on the urban location of the Site and former buildings, it is possible that fill materials from unknown origins were brought to the Site.
- Numerous unknown asphalt disturbances were observed by Benchmark in paving and stone parking areas, mostly in high traffic areas.
- Four existing monitoring wells, installed as part of previous subsurface investigations completed by others, were noted in the northern portion of the Site.
- Adjacent properties are currently utilized for industrial purposes, including manufacturing and warehousing. No concerns (staining, odors, obvious spills, etc.) were noted on-Site in connection with current adjacent operations.

7.0 INTERVIEWS

7.1 Site Owner

An Environmental Questionnaire requesting information on any known environmental hazards or impacts at the Site was completed by the current president of G.W. Burnett, Inc., Mr. Eric Bauer. Appendix H includes the completed questionnaire. The following summarizes the information provided by Mr. Bauer:

- The Site has been occupied by G.W. Burnett, Inc., a trucking and transportation company, since March 1978 and has been utilized for storage and maintenance purposes.
- Building 1 is currently utilizes and oil furnace which burns used motor oil as a secondary source of heat. Used motor oil is stored in an on-Site AST. Both buildings on-Site are primarily heated with natural gas heating systems.
- A 10,000-gallon AST identified as Tank 1 is located on-Site which contains on-road diesel fuel. The tank is registered and complies with December 1998 EPA requirements. In addition, Mr. Bauer indicated NYSDEC PBS certificates are issued every 5-years.
- To Mr. Bauer's knowledge, underground and/or aboveground tanks have previously been located on-Site and closure reports are available.
- Mr. Bauer indicated there have never been complaints or notices of violations associate with the existing facilities.

7.2 Municipal Interview

As indicated above, the City of Buffalo Building Inspector would not provide an interview relative to the Site. However, Benchmark interviewed the City of Buffalo Assessor, Mr. Jeremy Martz and the Fire Prevention Office, Captain Ron Barrett. Both individuals had no additional knowledge of environmental concerns associated with the Site.

7.3 Former Site Owner/Operator

Former owners/operators were not interviewed as part of this assessment.

8.0 OTHER ENVIRONMENTAL CONSIDERATIONS

Other environmental considerations are discussed below. Such include non-scope considerations, described under ASTM E1527-13 as ancillary conditions that are typically outside the standard Phase I scope of practice. Non-scope considerations, such as asbestos, lead, radon, wetlands and mold, are not considered RECs under ASTM E1527-13, but may represent health or environmental issues impacting the Site and/or property value.

8.1 Asbestos

Based on the ages of the existing buildings, the potential for asbestos exists. Suspect ACMs including, but not limited to, drywall/plaster, pipe wrap, floor tile and ceiling tile were noted at the time of the site visit. Asbestos could also be present in roofing materials. Damaged ceiling tiles were observed within bathroom areas of Building 2. Ceiling materials were noted to be damaged in the western portion of Building 2 with visible insulation protruding.

8.2 Lead Paint, Pipes and Soldering

Based on the age of the existing building, the potential for lead-based paint exists, lead pipe, and soldering. Peeling/chipping paint was observed on the exterior of the western portion of Building 2.

8.3 Radon

Research in the area of the Site completed by the New York State Department of Health - Bureau of Environmental Radiation Protection (Radon) suggests an average basement radon concentration of 1.14 pCi/L in the area of the Site, which is below the USEPA action level of 4.0 pCi/L. As such, radon is not anticipated to be a concern.

8.4 Wetlands and Flood Zones

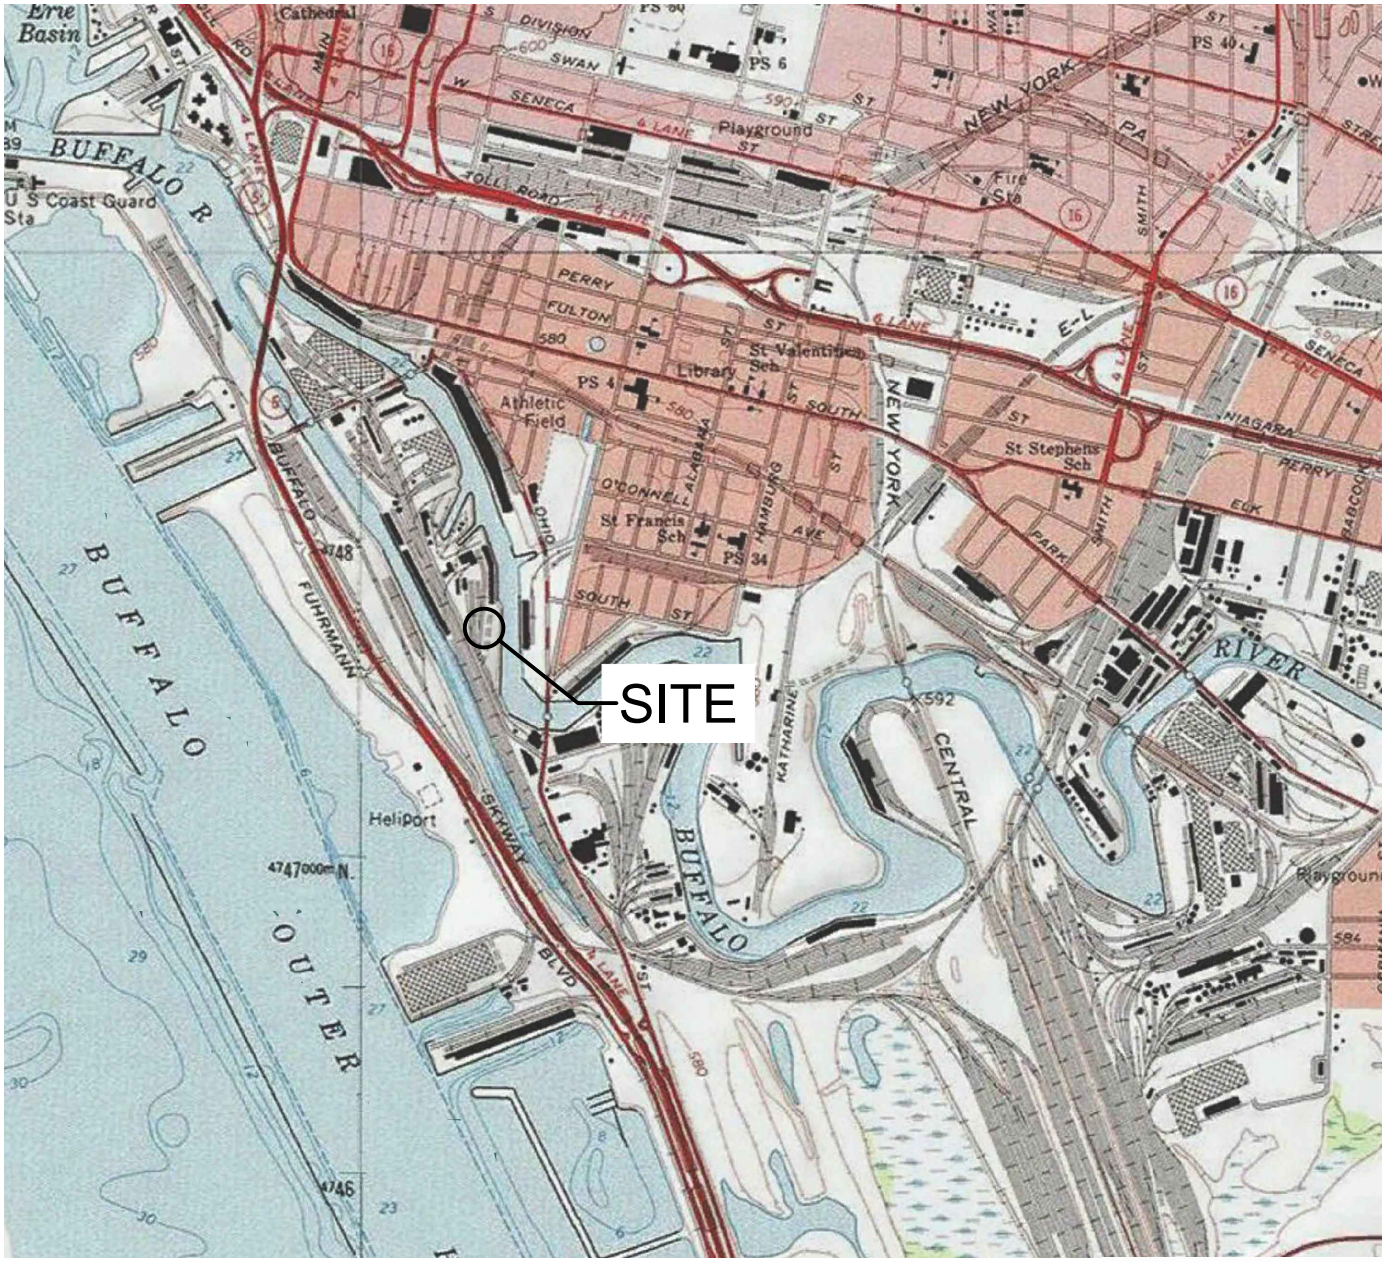
The EDR regulatory database includes general information on wetlands and flood zones. No wetland areas were identified on-site or adjacent to the Site. The southern half of the Site is located within the 100-year and 500-year flood zone areas.

8.5 Microbial Contamination (Mold)

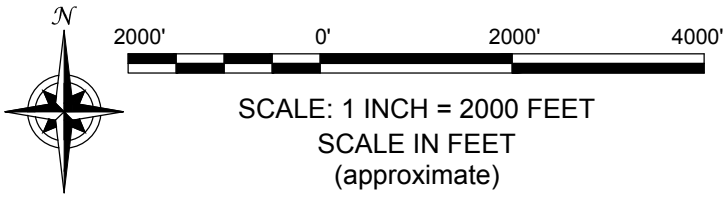
No visual evidence of mold was noted at the time of the Site reconnaissance.

8.6 Vapor Encroachment Conditions

This assessment included review of the regulatory database discussed in Section 6.1 in relation to the ASTM E2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions.



If soil or groundwater is contaminated with a volatile compound such as gasoline or solvents, that contaminant can migrate through the soil pore space and end up in the air inside of buildings, especially within basement areas. Soil vapors do not necessarily migrate along groundwater flow paths; they can also move up hydraulic gradients and can extend beyond a groundwater plume. The ASTM standard named this a VEC, which is a more recent environmental concern and there have been a significant number of sites where vapor intrusion has been discovered. The state and federal environmental regulators have "reopened" numerous spill and waste sites in order to assess whether vapor encroachment is a concern.



The historic industrial use of the Site along with numerous documented USTs represent a potential VEC.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 07/17/2018 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
ADM MILLING CO	***250 GANSON ST***	***0 - 1/8 (0.000 mi.)***	***A11***	***29***

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has

determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/17/2018 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 08/09/2018 has revealed that there are 4

NY SHWS sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 12/08/2017 has revealed that there are 3 NY SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 10/16/2018 has revealed that there are 10 NY LTANKS sites within approximately 0.5 miles of the target property.

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 2 NY CBS AST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 10 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

ABANDONED MINES: An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

A review of the ABANDONED MINES list, as provided by EDR, and dated 09/10/2018 has revealed that there is 1 ABANDONED MINES site within approximately 0.25 miles of the target property.

NY HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the NY HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 NY HSWDS site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 5 EDR Hist Auto sites within approximately 0.125 miles of the target property.

. Waste name: None

Date form received by agency: 08/18/1980
Site name: WASTE MGMT OF NY DOWNING CONTAINER SV
Classification: Large Quantity Generator

. Waste code: D000
. Waste name: Not Defined

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

FINDS:

Registry ID: 110004368201

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Land type: Facility is not located on Indian land. Additional information is not known.
Classification: Conditionally Exempt Small Quantity Generator
Description: Handler: generates 100 kg or less of hazardous waste per calendar month, and accumulates 1000 kg or less of hazardous waste at any time; or generates 1 kg or less of acutely hazardous waste per calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste

Handler Activities Summary:
U.S. importer of hazardous waste: No

ADM MILLING CO (Continued) **1000127734**

Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 01/01/2007
Site name: PILLSBURY CO THE
Classification: Conditionally Exempt Small Quantity Generator

Date form received by agency: 01/01/2006
Site name: PILLSBURY CO THE
Classification: Conditionally Exempt Small Quantity Generator

Date form received by agency: 05/13/1985
Site name: PILLSBURY CO THE
Classification: Not a generator, verified

. Waste code: X002
. Waste name: POLYCHLORINATED BIPHENOLS (PCBs)

Violation Status: No violations found

Evaluation Action Summary:
Evaluation date: 01/26/2011
Evaluation: COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation: Not reported
Date achieved compliance: Not reported
Evaluation lead agency: State

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

SUPERFUND (NON-NPL)

DEC Memo:	"07/18/16 TDJ WENT TO LOCATION WHICH IS THE SECTION OF THE PROPERTY WHERE TRACTOR TRAILERS ALWAYS HIT THEIR SADDLE TANKS CROSSING RR TRACKS TO GET TO LOADING AREA. A LINE OF DIESEL FUEL WAS LEFT FOR APPROX 200'. THE DRIVER NOTICED AND PLUGGED TANK. HE CROSSED TRACKS AGAIN TO TAKE TO REPAIR SHOP ACROSS STREET. THE PLUG WAS KNOCKED OUT AMD SPILLED ADDITIONAL FUEL ON STREET. THE PLUG WAS REPLACED AND TRUCK WAS TAKEN IN FOR REPAIRS. SOME FUEL REACHED SOME STANDING WATER IN THE LOT WHERE SORBENT PADS WERE PLACED. I GAVE SPEEDY DRY FROM TRUCK AND WENT TO OFICE TO GET SUPPLY TO COMPLETE CLEANUP. SORBENT WAS SPREAD ON ENTIRE SPILL AREA AND DRIVER AND CREW FROM 250 GANSON WILL SWEEP UP HEAVY STAINED AREAS. TRUCKING FIRM WILL PURCHASE A PALLET OF SPEEDY DRY TO REPLACE STOCK FROM DEC STORAGE AREA. DRUMS WERE RECEIVED FROM CLEAN HARBORS FOR WASTE COLLECTION AND DISPOSAL. NO WATERWAYS NOR DRAINS WERE AFFECTED. SAMUEL P. MERCURIO JR OWNER /OPERATOR 5280 ONTARIO CENTER ROAD ONTARIO, NY 14519 585-469-2709 07/22/16 TDJ RECEIVED 20 BAGS OF SPEEDY DRY FROM MERCURIO FOR REPAYMENT OF SPEEDY DRY GIVEN FOR SPILL. 09/20/16 TDJ SPOKE WITH SAM WHO STATED THAT CREDIT WAS GIVEN TO SAFETY KLEEN PRIOR WEEK TO DISPOSE ORF DRUMS. WILL GET RECEIPT WHEN AVAILABLE. RECEIVED DISPOSAL INFO FROM SAFETY KLEEN FOR DISPOSAL OF THREE DRUMS OF DIESEL CONTAMINATED MATERIAL WHICH WAS TAKEN TO SPRING SOURCE RECOVERY IN CINCINNATI,OH. SITE WAS CLEANED TO SATISFACTION OF DEC SITE MANAGER. NO FURTHER ACTION FIEL CLOSED TO ELECTRONIC ONLY"
Remarks:	"spill from saddle tank/broken fuel line/FD en route. Buffalo Fire just call and is asking for a DEC representative on scene."

DEC Memo:	"1/17/12 FG SPOKE TO ERIE COUNTY EMERGENCY SERVICES WHO RESPONDED TO THE INCIDENT LAST EVENING. THEY SAID THAT THE BUFFALO FIRE DEPARTMENT RESPONDED TO THE INCIDENT AND CLEARED THE SCENE. WOODWARD KILPATRICK WAS THE OFFICER IN CHARGE OF THE SCENE. FG SPOKE TO MR. KILPATRICK WHO SAID THE SOURCE WAS UNKNOWN. 18 WORKERS WERE EVACUATED FROM THE AREA AND ONE WAS TAKEN TO THE HOSPITAL AT HIS REQUEST TO BE CHECKED OUT. MR. KILPATRICK DID NOT KNOW IF HE HAD BEEN RELEASED. NONE OF THESE EMPLOYEES WERE IN DIRECT CONTACT OR IN THE AREA WHERE THE CHLORINE PROCESS TANKS ARE LOCATED. THE BUFFALO FIRE DEPARTMENT WERE LOOKING AT 4 CHLORINE PROCESS TANKS IN THE BUILDING AND CHECKING VALVES, EMERGENCY SHUT OFFS, EXHAUST FANS AND ALL AREAS BUT THEY COULD NOT DETERMINE A SOURCE. THEY OPENED SHUTTERS THAT WERE CLOSED AND VENTED THE AREA. THE READINGS WENT FROM 103 PPM TO LESS THAN .2 PPM ON THE DRAEGER TUBES AND THEY LEFT THE SCENE. THEY THINK THERE MAY BE MULTIPLE ISSUES AND WILL BE BACK ON SCENE TODAY TO CHECK FURTHER. FG WILL CONTACT MR. KILPATRICK AT 10AM TO DETERMINE WHEN THEY WILL BE BACK ON SITE FOR A FURTHER INVESTIGATION AND TO JOIN THE SITE VISIT. THE CITY OF BUFFALO (BFD) WAS ON SITE SO AN ADDITIONAL COMMUNITY NOTIFICATION IS NOT NECESSARY. THE SPILL WAS REFERRED TO THE DIVISION OF AIR FOR FOLLOW UP. SPILL IS CLOSED. ELECTRONIC FILE ONLY."
Remarks:	"Unknown amount of chlorine has been spilled from above company. Haz-Mat team is on scene evaluating spill."

DEC Memo:	"06/22/15 TDJ WENT TO LOCATION WHICH WAS THE SEMI-TRAILER LOADING DOCK PARKING AREA AT THE ADM MILLING FACILITY ON GANSON STREET. A TRAILER LEAVING THE YARD CROSSED THE RISE OVER THE RR TRACKS CATCHING HIS TRAILER SUPPORT STANDS ON A TRACK. THE SUPPORT BROKE AND WAS DRIVEN INTO THE REFRIGERANT DIESEL TANK CAUSING A SPILL. THE DRIVER WENT BACK INTO YARD WHERE APPROX.10-15 GALLONS OF DIESEL FUEL SPREAD ON LOOSE STONE/ASPHALT TO A LOW AREA WHERE WATER HAD COLLECTED. FUEL WAS ON WATER SURFACE AND WAS BOOMED AT EITHER END SO WATER DID NOT REACH THE RIVER NOR DRAIN GRATES. CONTRACTOR WAS BEING RETAINED BY TRUCING FIRM BUT PADS AND SPEEDY DRY WAS USED TO COLLECT FREE FUEL ON WATER AND ASPHALT BEFORE THEY ARRIVED. TRUCKING FIRM: TM MORLEY, 24471 NORTH RIVER ROAD, MT.CLEMENS, MI 586 465-6500 DISPATCH - BRUCE SAFETY - MIKE MORLEY DRIVER - MIKE 06/23/15 TDJ STOPPED BACK AT LOCATION WHERE CONTRACTOR HAD CLEANED SPEEDY DRY AREA AND CLEARED PADS AND BOOMS FROM WATER. SLIGHT SHEEN WAS OBSERVED ON WATER BUT FUEL WAS NOT SEEN ON ANY SURFACES. WILL CONTACT FOR DISPOSAL INFO. 10/13/15 TDJ RECEIVED DISPOSAL INFO FROM TM MORLEY FRO THREE DRUMS OF WASTE GENERATED FROM THE SPILL. MATERIAL WAS SENT TO CINCINNATI FOR DISPOSAL. SITE WAS CLEANED TO SATISFACTION OF DEC SITE MANAGER. NO FURTHER ACTION FILE CLOSED TO ELECTRONIC ONLY"
Remarks:	"While driving over train tracks the fuel tank was ruptured, spilling diesel to the tracks. Clean up is in progress."

Spiller Address:	333 GANSON
Spiller Company:	001
Contact Name:	RODGER BAILEY
DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was FG 5/31/01 FG SITE INSPECTION. MET MARK JUDD WHO WILL BE PURCHASING THE PROPERTY. HE SAID HE IS EXCAVATING TO TRY TO LOCATE A FORMER 14000 GALLON UST WHICH HAD BEEN IDENTIFIED AS PART OF A PHASE I COMPLETED ON THE PROPERTY. HE WILL BE EXCAVATING FOR ANOTHER POTENTIAL UST ON THE PROPERTY AS WELL. HE SAID ONTARIO SPECIALTY WILL BE RESPONSIBLE FOR THE REMEDIATION OF THE PETROLEUM CONTAMINATION DISCOVERED. THEY HAVEN'T FOUND ANY UST'S BUT DID LOCATE AN AREA OF PETROLEUM CONTAMINATED SOIL. SPOKE TO DANIELLE MCNAMARA WITH OSC. SHE WILL PROVIDE A COPY OF THE PHASE I. OSC WILL DISPOSE OF THE SOIL AT MODERN. THEY WILL COLLECT EXCAVATION SAMPLES AND PROVIDE DISPOSAL RECEIPTS. SHE SAID THE EXCAVATION WILL BE COMPLETED TODAY AND NO UST'S WERE LOCATED. 6/5/01 FG SPOKE TO JOHN BLACK WHO IS WORKING FOR THE PURCHASER, MARK JUDD. HE WILL SEND ME THE OWNER INFORMATION AND A COPY OF THE PHASE I COMPLETED. 6/14/01 FG DAVE DENK, MARTY DOSTER, MARK JUDD AND JOHN SCHENNE ALL MET REGARDING THIS SITE. MARK JUDD DID SOME TEST PITTING ON THE PROPERTY AND COLLECTED SOIL SAMPLES. SEVERAL OF THE TEST PITS ARE ABOVE TAGM LEVELS AND WOULD REQUIRE REMEDIATION. MR. JUDD WAS PLANNING ON EXCAVATING A FORMER SLIP ON THE PROPERTY. HE WOULD BE REQUIRED TO DISPOSE OF THAT MATERIAL BECAUSE IT IS OVER STARS. THE OTHER AREAS WOULD ALSO REQUIRE REMEDIATION. MARTY DOSTER DISCUSSED VOLUNTARY CLEANUPS AND BROWNFIELDS FOR THE SITE. MR. JUDD WILL CONSIDER ALL HIS OPTIONS AND GET BACK TO THIS OFFICE. THE CURRENT OWNER IS 201 GANSON ST INC. MR JUDD IS A POTENTIAL PURCHASER. HE WILL SUBMIT THE PHASE I & II COMPLETED FOR THIS SITE WITHIN THE NEXT SEVERAL WEEKS FOR REVIEW. 7/12/01 CALLED JOHN BLACK 703-709-6500 AND LEFT A MESSAGE FOR HIM TO RETURN THE CALL. CALLED DANIELLE MCNAMARA WITH OSC WHO SAID TO CALL JOHN BLACK. SHE SAID NOTHING HAS BEEN DONE ON THE SITE. SHE HAS THE LANDFILL APPROVAL AND IS WAITING FOR JOHN BLACK TO TELL HER WHAT TO DO. I REQUESTED THAT SHE TELL JOHN BLACK TO CALL ME AND TO GET ME THE PHASE I &II. SHE SAID BUFFALO INDUSTRIAL DIVING IS STILL BUYING THE PROPERTY. SHE DOES NOT KNOW THE ADDRESS OF THE OWNER OF THE PROPERTY. THE OWNER IS 201 GANSON ST, INC. CALLED MARK JUDD AND LEFT A MESSAGE FOR HIM TO CALL. 7/12/01 MARK JUDD CALLED AND SAID THAT HE WILL PROVIDE THE PHASE I & II COMPLETED FOR THE SITE. HE NEEDS TO HAVE THE NYSDEC EVALUATION OF WHAT WOULD BE REQUIRED BASED ON THESE REPORTS. WE AGREED THAT WE WOULD NEED TO MEET AGAIN WITH ALL INVOLVED PARTIES. MR. JUDD SAID HE HAS A CONTRACT TO PURCHASE THE PROPERTY AND COULD NOT AFFORD TO STAY IN BUSINESS IF WE REQUIRE REMEDIATION IN AREAS THAT HE WASN'T PLANNING ON REMOVING FOR THE SLIP. 11/05/01: FG SENT LETTER TO ONTARIO SPECIALTY REQUESTING THAT THEY COMPLETE SITE WORK OR SIGN A RIGHT-OF-ENTRY TO ALLOW NYSDEC TO COMPLETE SITE WORK BY 11/26/01. 12/11/01: MF FOR FG LETTER TO RP REQUESTING EXCAVATION SAMPLING RESULTS, SOIL DISPOSAL RECEIPTS & A WORK PLAN FOR ADDITIONAL REMEDIATION BY 1/9/02. 01/04/02: MF FOR FG DAVID FLYNN ATTY FOR OSC SUBMITTED 12/17/01 LETTER INDICATING HE WILL PROVIDE THE DISPOSAL RECEIPTS & EXCAVATION SAMPLE RESULTS SHORTLY. THE LETTER ALSO STATED THAT NO FURTHER WORK WOULD BE NECESSARY AT THE DRY DOCK AREAS. DEC RESPONDED INDICATING TEST PITS SHOWED LUBE OIL PRESENT IN ALL BUT 2

BUFFALO INDUSTRIAL DIVING (Continued) **S105057839**

TEST PITS, TP-10 & 11 HAVE EXCEEDANCES FOR TAGM LEVELS. REMEDIATION REQUESTED, PROPOSAL DUE 2/7/02. 03/07/02: MF FOR FG MEETING HELD AT DEC OFFICE WITH DAVE FLYNN, JIM WILLIAMS, JOHN BLACK, JACK AVERSA, PJB & FG. CONCLUSION WAS THAT JIM WILLIAMS WILL PROVIDE EXCAVATION SAMPLE RESULTS. THEY WILL NOTIFY THIS OFFICE WHEN THEY WILL DO THE SAMPLING SO WE CAN BE ON SITE. THEY WILL PROVIDE INFORMATION FROM THE PHASE 2 THAT WILL INCLUDE A DESCRIPTION OF THE SAMPLING THAT WAS COMPLETED. NYSDEC WILL THAN MAKE A DECISION ON THE NEED FOR REMEDIATION. THE DISPOSAL RECEIPTS FOR THE EXCAVATION COMPLETED IN THE FORMER UST AREA HAVE BEEN PROVIDED. 04/17/02 RMC/SITE. 1130AM, NO NEW EXCAVATION NOTED, BLACKTOP NEAR BUILDING ADJACENT THE FENCE HAS BEEN REMOVED, NO ONE ON SITE. 04/17/02 RMC/SITE. 4PM, MET MARK JUDD, BUFFALO INDUSTRIAL. THEY ARE THE PROSPECTIVE BUYERS. EXCAVATION DUG AND BACKFILLED. HE DID NOTICE WATER AND PETROLEUM ODORS. RMC TO RETURN TOM. AT 1130 AM TO INSPECT THE EXCAVATION. 04/18/02 RMC/SITE. 1130AM MET JOHN YENSAN, OSC THE OWNERS OF THE PROPERTY. HE TOOK THE MACHINE TO ANOTHER JOB WITH OUT OPENING THE EXCAVATION FOR INSPECTION. HE STATED THAT HE TOOK SAMPLES AND PICTURES, HE ALSO NOTED SLIGHT PETROLEUM ODORS. 05/31/02 RMC/JOHN YENSAN, OSC/SITE. TEST PIT DUG 10 FOOT DIAMETER, 8 FEET DEEP. SLIGHT SHEEN ON THE WATER. NO ELEVATED PID READINGS FROM SOIL EXCAVATED. DISCOLORED BACKFILL MATERIAL THRU THE ENTIRE DEPTH. OSC TOOK 5 SAMPLES FOR 8021/8270, STARS. 1/14/03 PJB INDICATED THAT OSC WAS WILLING TO COMPLETE ADDITIONAL GROUNDWATER WELLS ON SITE LAST FALL BUT HE HAS NOT HEARD FROM THEM AND THEY HAVE NOT COMPLETED THE SITE WORK YET. PJB WILL CONTACT OSC AND DAVID FLYNN AGAIN. 3/18/03 FG SITE INSPECTION. MET GREG FLIK WITH EMPIRE GEO SERVICES (SJB). HE SAID HE COMPLETED ONE WELL AND FOUND NO CONTAMINATION. THE OTHER ONE HAD SOME CRESOTE BUT NO SHEENING OR OIL. THE WELLS WILL BE SAMPLED AND WATER ELEVATIONS TAKEN LATER IN THE WEEK. 4/17/03 RECEIVED THE REPORT OF THE FINDINGS FROM THE INSTALLATION OF TWO WELLS AND SAMPLING OF ALL SITE WELLS. GROUNDWATER RESULTS SLIGHTLY EXCEED GROUNDWATER STANDARDS AT MW1, MW4 AND MW7. DUE TO THE REPORTED PRESENCE OF PETROLEUM IN THE SUBSURFACE SOILS AND THE EXCEEDANCE OF TAGM LEVELS AT THOSE LOCATIONS, THE SITE WILL BE MADE INACTIVE. AN INACTIVE LETTER HAS BEEN SENT OUT."

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

DEC Memo:	"10/14/15 FG SITE INSPECTION. BFD, ON SITE. TERRY DICKINSON WAS ON SITE. ICELAND TRANSPORT LOST THE 25 GALLON REFRIGERANT DIESEL TANK WHEN TRAVELING OVER THE RAILROAD TRACKS LEADING INTO ADM ON GANSON ST. APPROXIMATELY 8 GALLONS RELEASED FROM THE TANK. THE REMAINDER WAS IN THE TANK. ICELAND TRANSPORT DID NOT HAVE THE ABILITY TO HIRE A CLEANUP COMPANY AND TOLD THE DEPARTMENT TO CALL OUR CONTRACTOR ON SITE TO COMPLETE THE CLEANUP. FG CALLED BOB AT ICELAND TRANSPORT 1-800-523-2267. NATIONAL VAC, JOHN KOZLOWSKI ARRIVED ON SITE TO COMPLETE THE CLEANUP. THEY PLANNED TO SWEEP UP THE SPEEDI DRY TO DRUMS AND VAC OUT THE DIESEL FROM THE TANK FOR DISPOSAL. THEY WILL DISPOSE OF THE WASTE AND WILL BILL ICELAND TRANSPORT DIRECTLY. BUFFALO FIRE USED 15 BAGS OF SPEEDI DRY AND ONE PLUG WHICH THEY WOULD LIKE REPLACED. 2/10/16 FG CONTACTED NATIONAL VAC FOR DISPOSAL RECEIPTS. THEY SAID THEY HAVE THEM AND WILL FORWARD COPIES. 2/11/16 DISPOSAL RECEIPTS FOR 3 DRUMS OF CLEANUP DEBRIS PROVIDED FOR DISPOSAL AT EICS. NO FURTHER WORK IS REQUIRED. THE SITE IS CLOSED. ELECTRONIC FILE ONLY."

DEC Memo:	"6/4/14 FG SITE INSPECTION. DAN WULF WITH GZA ON SITE. DISCOVERED AN AREA OF PETROLEUM IMPACTS IN FRONT OF THE BUFFALO ROD AND GUN CLUB WHILE EXCAVATING TO INSTALL THE POWER LINES UNDERGROUND. THE IMPACTS WERE DIRECTLY IN FRONT OF THE 3 PHASE POWER POLE AND MARKER 4800. NATIONAL GRID BELIEVES THEY WILL FIND MORE IMPACTS ON THE ROD AND GUN CLUB PROPERTY WHERE THEY WILL BE EXCAVATING ADDITIONAL SOIL. THEY WILL BE AT THAT AREA WITHIN ONE WEEK AND WILL NOTIFY THE DEPARTMENT IF THEY ENCOUNTER ANY IMPACTED SOILS. 1/2 A TRUCK LOAD WAS TAKEN TO THEIR STAGING AREA FOR DISPOSAL. THE IMPACTS WERE ONLY NOTED ON THE BUFFALO ROD AND GUN CLUB SIDE OF THE EXCAVATION AND NOT ON THE STREET SIDE. FG TOOK A SAMPLE COLLECTED BY DAN WULF FROM THE IMPACTED AREA

EXCAVATION (Continued) **S117267301**

FOR ANALYSIS. DAN WULF SAID THAT THEY WOULD BE EXCAVATING FURTHER INTO THE ROD AND GUN CLUB PROPERTY AND WOULD NOTIFY THE DEPARTMENT IF ANY FURTHER IMPACTS WERE NOTED. 6/16/14 TESTAMERICA SUBMITTED THE ANALYTICAL RESULTS. FUEL OIL #2 WAS IDENTIFIED AT 130 PPM. PETROLEUM COMPOUNDS WELL BELOW CP51 LEVELS WERE ALSO IDENTIFIED. 7/30/14 TESTAMERICA SUBMITTED THE PAYMENT PACKAGES. NO FURTHER WORK IS REQUIRED. THE SITE IS INACTIVE DUE TO THE DISCOVERY OF THE FUEL OIL #2. 10/3/14 WATTS SUBMITTED THE DISPOSAL RECEIPTS FOR THE IMPACTED SOIL. NO FURTHER WORK IS REQUIRED. THE SITE IS INACTIVE."

Remarks: "while excavating 3- 5cubic yards found at 1.5-2 feet ozm 128 parts per million"

EXCAVATION (Continued) **S116554768**

Contact Name: LISA
DEC Memo: "4/24/14 FG SITE INSPECTION. MET DANIEL WULF WITH GZA AND ARTHUR SALVATI WITH WENDEL. GZA IS WORKING FOR NATIONAL GRID INSTALLING THE ELECTRIC LINE UNDERGROUND WHEN THEY FOUND SOME IMPACTED SOIL. PETROLEUM IMPACTED SOIL WAS DISCOVERED 6 FTBGS NEAR AN OLD SEWER LINE - ABANDONED - CLAY. THE SOIL WAS BEING STAGED AT THE CATCO SITE FOR STAGING FURTHER DOWN OHIO ST. THE SOIL IS BEING DISPOSED BY THE CITY OF BUFFALO. THERE ARE 7 IMPACTED AREAS THAT WERE PREVIOUSLY STUDIED. THIS IS OUTSIDE THE PREVIOUSLY IDENTIFIED AREAS. GZA WAS DONE DIGGING THE NECESSARY AREA AND THE ODOR AND ELEVATED PID APPEARED TO BE LIMITED TO THE NORTH EAST CORNER OF THE EXCAVATION. FG SPOKE TO JOHN HONAN WITH WATTS WHO CONDUCTED THE SUBSURFACE INVESTIGATION AND HE WILL PROVIDE THE REPORT OF FINDINGS THAT IDENTIFIED THE 7 AREAS OF PETROLEUM IMPACTS. 4/25/14 JOHN HONAN PROVIDED THE FOLLOWING UPDATE: Francine: I am following up on our phone call from yesterday regarding the reporting of contaminated materials that we encounter on this project. As I indicated, I did speak with Marty Doster after we spoke to bring him up to speed. He, in turn, had Tony Lopes, the BCP Project Manager for the Sam s Petro site, contact me, as they are interested in characterizing the locations where we observed contaminated soil from this site. Tony then met us on-site today to review the Sam s site, and then we also visited the South Street site where National Grid reported a spill yesterday (i.e. where they encountered contaminated soils). Apparently the South Street is nearby another Brownfield Cleanup Program location that Tony s group is working on. We then visited the soil stockpiles for both the Sam s site and South Street site where the soil is being staged prior to landfill disposal. With regard to our sending you our original sampling report for Ohio Street that you requested I had trouble sending you the report via the DEC ftp site. So I made a CD of the project proposal book and gave it to Tony Lopes this morning. He said he would deliver it to you. The contaminated materials investigations are contained within this document on Pages 446-538. Please let us know if you have any questions on this or require further information on this. Going forward, here is our understanding of how NYSDEC would like us to report any contaminated materials we encounter on the project: - For contaminated soil encountered near Sam s Petro or the Rod and Gun Club (two current NYSDEC BCP sites), we will report these incidents to Marty Doster and he will refer us to the appropriate BCP Project Manager for their follow up. - For contaminated soil encountered anywhere else, we will call the NYSDEC spill hotline (1-800-457-7362). Contaminated soils are being stockpiled, and segregated by location, for later disposal at a landfill. We will send to your attention the landfill disposal receipts from each site, as you requested. I think this covers what we discussed yesterday, with the addition of some of the information we received today from Tony Lopes. Please let me know if there are any questions or additional information you need at this time. Thank you for your assistance with this project. JCH John C. Honan, P.E. Senior Associate Watts Architecture & Engineering 95 Perry Street, Suite 300 Buffalo, New York 14203 (716) 206-5112 (716) 206-5199 Fax jhonan@watts-ae.com www.watts-ae.com Amy L. HE SAID THEY UNCOVERED SOME PETROLEUM IMPACTED SOIL WHILE EXCAVATING FOR THE NEW PARKING AREA AT THE NYSDEC PARKING AREA ALONG THE BUFFALO RIVER. HE SAID THEY WILL STAGE THE IMPACTED SOIL AT THE OHIO STREET STAGING AREA AND DISPOSE OF THE SOIL. HE WILL PROVIDE A DISPOSAL RECEIPT. 10/7/14 TONY LOPES WITH REMEDIATION INSPECTED THE AREA. HE SAID THAT HE NOTED NO IMPACTS IN THE EXCAVATED AREA. 1/15/15 WATTS ARCHITECTURE AND ENGINEERING PROVIDED A COPY OF THE DISPOSAL RECEIPTS FOR THE SOIL DISPOSED OF. 92.8 TONS OF IMPACTED SOIL WAS DISPOSED AT THE TONAWANDA LANDFILL. NO FURTHER WORK IS REQUIRED. THE SITE IS CLOSED. "
Remarks:	"Clean up is in progress"

Date Record Added:	10/27/2016
Date Rec Updated:	04/05/2017
Updated By:	SJSTYK
Site Description:	Location: The Site is located in an urban area with an official street address at 9 South Street near the intersection of Ohio Street in the City of Buffalo. Site Features: The site is a 1.78-acre portion of a larger 2.25 acre parcel. The topography of the site and vicinity is generally flat with little topographic elevation change.

441 OHIO STREET SITE (Continued) **S116287480**

The land surface is only several feet above the water level of the adjoining Buffalo River and is situated within the 100 year floodplain of the river. The non-BCP portion of the 2.25 acre parcel is considered lands under water along the Buffalo River. This area may have been previously dredged to allow docking of commercial freight ships and barges. Current improvements consist of a recently constructed five story apartment building (2017). Previous improvements on the site consisted of a 500 x 100 foot 2-story wood framed building that occupied most of the site. The building was in an extremely dilapidated condition and had been condemned by the City of Buffalo Building Department. The building structure and most of the foundation was demolished in Spring 2015. A stone foundation wall abutting the Buffalo River was retained to be used as a retaining wall and historic riverfront architectural remnant desired by the local preservation community. The balance of the site is mostly paved or covered with gravel with some minor vegetated strip areas. A rail spur leads to the northern side of the site. Multiple rails lines previously lead to the interior of the former building. Current Zoning and Land Use: The site is located in the M2, General Industrial District, but has transitioned to Mixed Use Edge Residential (N-2E and N-2R) under the revised Buffalo Green Code. The site is bounded by South Street to the north, with the NYSDEC recreational boat launch beyond; commercial and recreational property to the south (Bison City Rod and Gun Club), a vacant lot and Ohio Street to the east, and the Buffalo River along the western property line. Past Use of the Site: The site has been used for various freight and warehousing operations from as early as 1889. Operations included intermodal (lake freight, rail and trucking) material handling and shipping, equipment use and maintenance, paper recycling and bundling equipment. There was some nominal storage of paints, solvents, thinners, greases, hydraulic oils, and lubricants commonly used by the former commercial recycle paper handling operations inside the former building. Site Geology and Hydrogeology: The site is located within the Erie-Ontario lake plain physiographic province, which is typified by little topographic relief and gentle slope toward Lake Erie. Surface soils at the site consist of a layer of fill, varying in thickness from 2 to 4 feet, containing foundry sand, crushed slag, mixed soil and hard demolition debris. Below the fill layer exists a layer of reworked soil consisting of native looking soil mix containing sand, silt and clayey soils and varies in thickness from 2 to 7 feet. Native soil below consists of a lean brown clay with varying amounts of silt, sand and gravel. A sandy soil formation exists below this clay soil layer along the northern half of the site. The native soils are encountered at depths varying from 4 to 10 feet below the surface and extend to bedrock at depths varying from 25 to 30 feet below ground surface. Bedrock consists of the Onondaga limestone formation. Groundwater depth is approximately 10 to 11 feet below ground surface. Based on area topography and proximity to the Buffalo River, the groundwater gradient is relatively flat, and flows in a westerly direction toward the river.

Env Problem: Nature and Extent of Contamination: Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were poly-cyclic aromatic hydrocarbons (PAHs), the metals arsenic, barium, lead and mercury and poly-chlorinated biphenyls (PCBs) in soil/fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a

The land surface is only several feet above the water level of the adjoining Buffalo River and is situated within the 100 year floodplain of the river. The non-BCP portion of the 2.25 acre parcel is considered lands under water along the Buffalo River. This area may have been previously dredged to allow docking of commercial freight ships and barges. Current improvements consist of a recently constructed five story apartment building (2017). Previous improvements on the site consisted of a 500 x 100 foot 2-story wood framed building that occupied most of the site. The building was in an extremely dilapidated condition and had been condemned by the City of Buffalo Building Department. The building structure and most of the foundation was demolished in Spring 2015. A stone foundation wall abutting the Buffalo River was retained to be used as a retaining wall and historic riverfront architectural remnant desired by the local preservation community. The balance of the site is mostly paved or covered with gravel with some minor vegetated strip areas. A rail spur leads to the northern side of the site. Multiple rails lines previously lead to the interior of the former building. Current Zoning and Land Use: The site is located in the M2, General Industrial District, but has transitioned to Mixed Use Edge Residential (N-2E and N-2R) under the revised Buffalo Green Code. The site is bounded by South Street to the north, with the NYSDEC recreational boat launch beyond; commercial and recreational property to the south (Bison City Rod and Gun Club), a vacant lot and Ohio Street to the east, and the Buffalo River along the western property line. Past Use of the Site: The site has been used for various freight and warehousing operations from as early as 1889. Operations included intermodal (lake freight, rail and trucking) material handling and shipping, equipment use and maintenance, paper recycling and bundling equipment. There was some nominal storage of paints, solvents, thinners, greases, hydraulic oils, and lubricants commonly used by the former commercial recycle paper handling operations inside the former building. Site Geology and Hydrogeology: The site is located within the Erie-Ontario lake plain physiographic province, which is typified by little topographic relief and gentle slope toward Lake Erie. Surface soils at the site consist of a layer of fill, varying in thickness from 2 to 4 feet, containing foundry sand, crushed slag, mixed soil and hard demolition debris. Below the fill layer exists a layer of reworked soil consisting of native looking soil mix containing sand, silt and clayey soils and varies in thickness from 2 to 7 feet. Native soil below consists of a lean brown clay with varying amounts of silt, sand and gravel. A sandy soil formation exists below this clay soil layer along the northern half of the site. The native soils are encountered at depths varying

441 OHIO STREET SITE (Continued) **S116287480**

from 4 to 10 feet below the surface and extend to bedrock at depths varying from 25 to 30 feet below ground surface. Bedrock consists of the Onondaga limestone formation. Groundwater depth is approximately 10 to 11 feet below ground surface. Based on area topography and proximity to the Buffalo River, the groundwater gradient is relatively flat, and flows in a westerly direction toward the river.

Env Problem: Nature and Extent of Contamination: Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were poly-cyclic aromatic hydrocarbons (PAHs), the metals arsenic, barium, lead and mercury and poly-chlorinated biphenyls (PCBs) in soil/fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: Measures are in place to address residual contamination at the site and therefore, contact with these contaminants is not expected.

Site Code: 491163
Site Description: Location: The Site is located in an urban area with an official street address at 9 South Street near the intersection of Ohio Street in the City of Buffalo. Site Features: The site is a 1.78-acre portion of a larger 2.25 acre parcel. The topography of the site and vicinity is generally flat with little topographic elevation change. The land surface is only several feet above the water level of the adjoining Buffalo River and is situated within the 100 year floodplain of the river. The non-BCP portion of the 2.25 acre parcel is considered lands under water along the Buffalo River. This area may have been previously dredged to allow docking of commercial freight ships and barges. Current improvements consist of a recently constructed five story apartment building (2017). Previous improvements on the site consisted of a 500 x 100 foot 2-story wood framed building that occupied most of the site. The building was in an extremely dilapidated condition and had been condemned by the City of Buffalo Building Department. The building structure and most of the foundation was demolished in Spring 2015. A stone foundation wall abutting the Buffalo River was retained to be used as a retaining wall and historic riverfront architectural remnant desired by the local preservation community. The balance of the site is mostly paved or covered with gravel with some minor vegetated strip areas. A rail spur leads to the northern side of the site. Multiple rails lines previously lead to the interior of the former building. Current Zoning and Land Use: The site is located in the M2, General Industrial District, but has transitioned to Mixed Use Edge

441 OHIO STREET SITE (Continued) **S116287480**

Residential (N-2E and N-2R) under the revised Buffalo Green Code. The site is bounded by South Street to the north, with the NYSDEC recreational boat launch beyond; commercial and recreational property to the south (Bison City Rod and Gun Club), a vacant lot and Ohio Street to the east, and the Buffalo River along the western property line. Past Use of the Site: The site has been used for various freight and warehousing operations from as early as 1889. Operations included intermodal (lake freight, rail and trucking) material handling and shipping, equipment use and maintenance, paper recycling and bundling equipment. There was some nominal storage of paints, solvents, thinners, greases, hydraulic oils, and lubricants commonly used by the former commercial recycle paper handling operations inside the former building. Site Geology and Hydrogeology: The site is located within the Erie-Ontario lake plain physiographic province, which is typified by little topographic relief and gentle slope toward Lake Erie. Surface soils at the site consist of a layer of fill, varying in thickness from 2 to 4 feet, containing foundry sand, crushed slag, mixed soil and hard demolition debris. Below the fill layer exists a layer of reworked soil consisting of native looking soil mix containing sand, silt and clayey soils and varies in thickness from 2 to 7 feet. Native soil below consists of a lean brown clay with varying amounts of silt, sand and gravel. A sandy soil formation exists below this clay soil layer along the northern half of the site. The native soils are encountered at depths varying from 4 to 10 feet below the surface and extend to bedrock at depths varying from 25 to 30 feet below ground surface. Bedrock consists of the Onondaga limestone formation. Groundwater depth is approximately 10 to 11 feet below ground surface. Based on area topography and proximity to the Buffalo River, the groundwater gradient is relatively flat, and flows in a westerly direction toward the river.

Env Problem: Nature and Extent of Contamination: Post-Remediation: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were poly-cyclic aromatic hydrocarbons (PAHs), the metals arsenic, barium, lead and mercury and poly-chlorinated biphenyls (PCBs) in soil/fill. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan."

Health Problem: Measures are in place to address residual contamination at the site and therefore, contact with these contaminants is not expected.

399 OHIO STREET SITE (Continued) **S116712570**

Site Description:	Location: The 399 Ohio Street Site is located in an urban area of the City of Buffalo. The site is approximately 1/4 mile south of the intersection with Michigan Avenue. Site Features: The main site features on this 5.0 acre site includes a newly constructed 52,000 square foot mixed use building for restaurants, commercial space, and residential apartments to the north and an approximately 10,000 square foot vehicle maintenance building to the south. The remaining area in-between these two buildings is planned for future phases of the development and is covered with blacktop. The site is generally flat and bordered by the River Fest Park to the north, a rowing club to the south, Ohio Street to the east, and the Buffalo River to the west. Current Zoning and Land Use: The site is zoned for commercial use and contains a newly constructed building to the north for apartments along with future restaurants/commercial space, and a maintenance building to the south. The surrounding parcels are currently used for a combination of commercial, light industrial, and utility right-of-ways. The nearest residential area is 0.3 miles to the east. Past Use of the Site: The site has been utilized for various industrial and commercial operations since at least 1889. Operations included rail lines, material handling and shipping equipment maintenance, and the use and storage of paints, solvents, thinners, greases, hydraulic oils and lubricants common among former commercial operations. More recently property uses have included the operation of bus and trucking terminal and maintenance operations, including the placement of underground storage tanks, aboveground storage tanks, and fuel dispensing pump(s). Geology and Hydrogeology: The site consists of 4-6 feet of fill (soil, ash, brick, and sand) over native clay. Shallow groundwater was encountered at 4-6 feet below ground surface and flows westward towards the Buffalo River.
Env Problem:	Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were SVOCs, arsenic, cadmium and lead in soil and PAHs and metals in groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil and groundwater is being managed under a Site Management Plan.
Health Problem:	Measures are in place to control the potential for coming in contact with residual subsurface soil and groundwater contamination at the site.

FINDS:

Registry ID: 110067265033

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description:	Location: The 300 Ohio Street site is located in an urban/industrial area and consists of eleven (11) adjoining tax parcels, totaling 4.825 acres in size, at the corner of Ohio Street and Chicago Street in the City of Buffalo. The Buffalo River is to the west across Chicago Street, and the City of Buffalo Conway Park is to the east. Site Features: The main site features include an inactive truck terminal, restaurant/office building, five pump islands with product dispensers, and three (3) abandoned buildings. A majority of the site

SAM'S TRUCK STOP #110 (Continued) **U003317438**

	is paved. Grass covered areas are present in the northwest quadrant of the site. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, industrial, residential, railroad right-of-way, vacant parcels, and parkland. The nearest residential development is less than 0.2 miles to the east and southwest and less than 0.4 miles to the north. Past Use of the Site: Until the late 1990s a portion of the site were used as an auto/truck gas and service station, dating back to 1925. The two buildings on the northern portion of the site along Chicago and Mackinaw Street (E&B Machinery and Central Manufacturing) operated as a machine shop, trucking terminal and coffin and cooperage manufacturing operations. Prior uses that appear to have led to site contamination are associated with the gas and service station operations, including the use of up to fifteen (15) underground storage tanks (USTs), one above ground storage tank (AST), and the use of solvents and oils during auto/truck repair activities. A 2010 Limited Phase II Site Assessment revealed evidence of significant subsurface petroleum contamination related to the former operation of a petroleum filling station and fuel distribution operation. Multiple NYSDEC Spill files have been associated with the site. Municipal records indicate UST replacements due to leaking tanks. Petroleum Bulk Storage (PBS) records indicate that two 20,000 gallon No. 2 fuel oil USTs were closed in place on-site. In November 2011 the site entered the Brownfield Cleanup Program and a remedial investigation commenced. Site Geology and Hydrogeology: The site is overlain by 8 feet of fill (sand, gravel, asphalt, brick), underlain by silty sandy clay grading into a brown silty clay unit. Shallow groundwater is at 4-6 feet below ground surface (fbgs) and flows west towards the Buffalo River. A site location map is attached as Figure 1.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminant of concern were arsenic, cadmium, lead, several polycyclic aromatic hydrocarbons (PAHs) and grossly contaminated media (GCM). Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem:	This Health Assessment is presently being updated and will be posted upon receipt from the NYSDOH.

Site Description: Location: The 300 Ohio Street site is located in an urban/industrial area and consists of eleven (11) adjoining tax parcels, totaling

SAM'S TRUCK STOP #110 (Continued) **U003317438**

4.825 acres in size, at the corner of Ohio Street and Chicago Street in the City of Buffalo. The Buffalo River is to the west across Chicago Street, and the City of Buffalo Conway Park is to the east. Site Features: The main site features include an inactive truck terminal, restaurant/office building, five pump islands with product dispensers, and three (3) abandoned buildings. A majority of the site is paved. Grass covered areas are present in the northwest quadrant of the site. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, industrial, residential, railroad right-of-way, vacant parcels, and parkland. The nearest residential development is less than 0.2 miles to the east and southwest and less than 0.4 miles to the north. Past Use of the Site: Until the late 1990s a portion of the site were used as an auto/truck gas and service station, dating back to 1925. The two buildings on the northern portion of the site along Chicago and Mackinaw Street (E&B Machinery and Central Manufacturing) operated as a machine shop, trucking terminal and coffin and cooperage manufacturing operations. Prior uses that appear to have led to site contamination are associated with the gas and service station operations, including the use of up to fifteen (15) underground storage tanks (USTs), one above ground storage tank (AST), and the use of solvents and oils during auto/truck repair activities. A 2010 Limited Phase II Site Assessment revealed evidence of significant subsurface petroleum contamination related to the former operation of a petroleum filling station and fuel distribution operation. Multiple NYSDEC Spill files have been associated with the site. Municipal records indicate UST replacements due to leaking tanks. Petroleum Bulk Storage (PBS) records indicate that two 20,000 gallon No. 2 fuel oil USTs were closed in place on-site. In November 2011 the site entered the Brownfield Cleanup Program and a remedial investigation commenced. Site Geology and Hydrogeology: The site is overlain by 8 feet of fill (sand, gravel, asphalt, brick), underlain by silty sandy clay grading into a brown silty clay unit. Shallow groundwater is at 4-6 feet below ground surface (fbgs) and flows west towards the Buffalo River. A site location map is attached as Figure 1.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminant of concern were arsenic, cadmium, lead, several polycyclic aromatic hydrocarbons (PAHs) and grossly contaminated media (GCM). Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.

Health Problem: This Health Assessment is presently being updated and will be posted upon receipt from the NYSDOH.

SAM'S TRUCK STOP #110 (Continued) **U003317438**

Dt rec updated: 01/02/2018
Updated By: MJRYAN
Site Code: 451883
Site Description: Location: The 300 Ohio Street site is located in an urban/industrial area and consists of eleven (11) adjoining tax parcels, totaling 4.825 acres in size, at the corner of Ohio Street and Chicago Street in the City of Buffalo. The Buffalo River is to the west across Chicago Street, and the City of Buffalo Conway Park is to the east. Site Features: The main site features include an inactive truck terminal, restaurant/office building, five pump islands with product dispensers, and three (3) abandoned buildings. A majority of the site is paved. Grass covered areas are present in the northwest quadrant of the site. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, industrial, residential, railroad right-of-way, vacant parcels, and parkland. The nearest residential development is less than 0.2 miles to the east and southwest and less than 0.4 miles to the north. Past Use of the Site: Until the late 1990s a portion of the site were used as an auto/truck gas and service station, dating back to 1925. The two buildings on the northern portion of the site along Chicago and Mackinaw Street (E&B Machinery and Central Manufacturing) operated as a machine shop, trucking terminal and coffin and cooperage manufacturing operations. Prior uses that appear to have led to site contamination are associated with the gas and service station operations, including the use of up to fifteen (15) underground storage tanks (USTs), one above ground storage tank (AST), and the use of solvents and oils during auto/truck repair activities. A 2010 Limited Phase II Site Assessment revealed evidence of significant subsurface petroleum contamination related to the former operation of a petroleum filling station and fuel distribution operation. Multiple NYSDEC Spill files have been associated with the site. Municipal records indicate UST replacements due to leaking tanks. Petroleum Bulk Storage (PBS) records indicate that two 20,000 gallon No. 2 fuel oil USTs were closed in place on-site. In November 2011 the site entered the Brownfield Cleanup Program and a remedial investigation commenced. Site Geology and Hydrogeology: The site is overlain by 8 feet of fill (sand, gravel, asphalt, brick), underlain by silty sandy clay grading into a brown silty clay unit. Shallow groundwater is at 4-6 feet below ground surface (fbgs) and flows west towards the Buffalo River. A site location map is attached as Figure 1.
Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminant of concern were arsenic, cadmium, lead, several polycyclic aromatic hydrocarbons (PAHs) and grossly contaminated media (GCM). Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem: This Health Assessment is presently being updated and will be posted upon receipt from the NYSDOH.

Site Code: 451883
Site Description: Location: The 300 Ohio Street site is located in an urban/industrial area and consists of eleven (11) adjoining tax parcels, totaling 4.825 acres in size, at the corner of Ohio Street and Chicago Street in the City of Buffalo. The Buffalo River is to the west across Chicago Street, and the City of Buffalo Conway Park is to the east. Site Features: The main site features include an inactive truck terminal, restaurant/office building, five pump islands with product dispensers, and three (3) abandoned buildings. A majority of the site is paved. Grass covered areas are present in the northwest quadrant of the site. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, industrial, residential, railroad right-of-way, vacant parcels, and parkland. The nearest residential development is less than 0.2 miles to the east and southwest and less than 0.4 miles to the north. Past Use of the Site: Until the late 1990s a portion of the site were used as an auto/truck gas and service station, dating back to 1925. The two buildings on the northern portion of the site along Chicago and

SAM'S TRUCK STOP #110 (Continued) **U003317438**

Mackinaw Street (E&B Machinery and Central Manufacturing) operated as a machine shop, trucking terminal and coffin and cooperage manufacturing operations. Prior uses that appear to have led to site contamination are associated with the gas and service station operations, including the use of up to fifteen (15) underground storage tanks (USTs), one above ground storage tank (AST), and the use of solvents and oils during auto/truck repair activities. A 2010 Limited Phase II Site Assessment revealed evidence of significant subsurface petroleum contamination related to the former operation of a petroleum filling station and fuel distribution operation. Multiple NYSDEC Spill files have been associated with the site. Municipal records indicate UST replacements due to leaking tanks. Petroleum Bulk Storage (PBS) records indicate that two 20,000 gallon No. 2 fuel oil USTs were closed in place on-site. In November 2011 the site entered the Brownfield Cleanup Program and a remedial investigation commenced. Site Geology and Hydrogeology: The site is overlain by 8 feet of fill (sand, gravel, asphalt, brick), underlain by silty sandy clay grading into a brown silty clay unit. Shallow groundwater is at 4-6 feet below ground surface (fbgs) and flows west towards the Buffalo River. A site location map is attached as Figure 1.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminant of concern were arsenic, cadmium, lead, several polycyclic aromatic hydrocarbons (PAHs) and grossly contaminated media (GCM). Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.

Health Problem: This Health Assessment is presently being updated and will be posted upon receipt from the NYSDOH.

BROWNFIELDS:

Program:	BCP
Site Code:	451883
Acres:	4.825
HW Code:	C915257
SWIS:	1502
Town:	Buffalo (c)
Record Added Date:	07/18/2011
Record Updated Date:	02/05/2018
Update By:	CRSTANIS
Site Description:	Location: The 300 Ohio Street site is located in an urban/industrial area and consists of eleven (11) adjoining tax parcels, totaling 4.825 acres in size, at the corner of Ohio Street and Chicago Street in the City of Buffalo. The Buffalo River is to the west across Chicago Street, and the City of Buffalo Conway Park is to the east. Site Features: The main site features include an inactive truck terminal, restaurant/office building, five pump islands with product dispensers, and three (3) abandoned buildings. A majority of the site is paved. Grass covered areas are present in the northwest quadrant of the site. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial, industrial,

SAM'S TRUCK STOP #110 (Continued) **U003317438**

	residential, railroad right-of-way, vacant parcels, and parkland. The nearest residential development is less than 0.2 miles to the east and southwest and less than 0.4 miles to the north. Past Use of the Site: Until the late 1990s a portion of the site were used as an auto/truck gas and service station, dating back to 1925. The two buildings on the northern portion of the site along Chicago and Mackinaw Street (E&B Machinery and Central Manufacturing) operated as a machine shop, trucking terminal and coffin and cooperage manufacturing operations. Prior uses that appear to have led to site contamination are associated with the gas and service station operations, including the use of up to fifteen (15) underground storage tanks (USTs), one above ground storage tank (AST), and the use of solvents and oils during auto/truck repair activities. A 2010 Limited Phase II Site Assessment revealed evidence of significant subsurface petroleum contamination related to the former operation of a petroleum filling station and fuel distribution operation. Multiple NYSDEC Spill files have been associated with the site. Municipal records indicate UST replacements due to leaking tanks. Petroleum Bulk Storage (PBS) records indicate that two 20,000 gallon No. 2 fuel oil USTs were closed in place on-site. In November 2011 the site entered the Brownfield Cleanup Program and a remedial investigation commenced. Site Geology and Hydrogeology: The site is overlain by 8 feet of fill (sand, gravel, asphalt, brick), underlain by silty sandy clay grading into a brown silty clay unit. Shallow groundwater is at 4-6 feet below ground surface (fbgs) and flows west towards the Buffalo River. A site location map is attached as Figure 1.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminant of concern were arsenic, cadmium, lead, several polycyclic aromatic hydrocarbons (PAHs) and grossly contaminated media (GCM). Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem:	This Health Assessment is presently being updated and will be posted upon receipt from the NYSDOH.

DEC Memo:	"03/23/10: MF BID PACKAGE TO NW, MATRIX & RUSSO. 03/26/10: MF BIBS ALL RETURNED, LOWEST RUSSO. T/C ERIC RUSSO, THEY WILL BE ABLE TO START 3/31/10 WHEN UTILITIES MARKED OUT. 03/31/10: MF S/V/RUSSO, MIKE BEAVER/LCS, ADAM ZEBROWSKI/PAT, NATIONAL VAC. ADVANCING 39-40 BORINGS BASED ON BID. BORINGS TO 16', WATER APPX 12', THIS IS LOT BEHIND FUELING AREA WHERE UST'S MAY HAVE BEEN. NAT FUEL MARKED OUT MED PRESSURE NATURAL GAS LINE. 4/16/10 FG RECEIVED THE ANALYTICAL DATA COLLECTED ON 3/31/10 FROM BH1 8-10, BH10 0-2, BH11 4-8, BH12 8-12, BH13 4-8. THE RESULTS ARE FOR TOTAL 8260'S AND 8270'S PPB: 8270: BH1 800, BH10 17000, BH11 3610, BH13 ND 8260: BH1 ND, BH10 1817, BH11 30200, BH13 526 4/21/10 UPSTATE SUBMITTED THE ANALYTICAL DATA COLLECTED ON 4/1/10 FROM BH12 0-2, BH18 0-4, BH19 2-4, BH21 6-8, BH23 6-8, BH24 2-4, BH25 0-4, BH26 8-10, BH27 8-10, BH28 6-8, BH29 10-12, BH30 8-12, BH31 8-10, BH34 6-8, BH37 0-4, BH38 6-8, BH40 8-10, BH41 4-8, BH42 2-4. THE RESULTS ARE FOR TOTAL 8260'S AND 8270'S PPB: 8270:

SAM'S TRUCK STOP #110 (Continued) **U003317438**

BH15 21,000, BH42 17030000, BH41 851000, BH40 30000, BH38 22600, BH37 2700, BH34 130, BH31 64600, BH30 1280, BH29 70, BH28 17000, BH27 90, BH26 60, BH25 7350, BH24 186000, BH23 1070, BH21 1900, BH19 207000, BH18 59000, 8260: BH15 2300, BH42 1800, BH41 2900, BH40 ND, BH38 ND, BH37 31700, BH34 400, BH31 2900, BH30 ND, BH29 ND, BH28 4100, BH27 14400, BH26 ND, BH25 2020, BH24 6000, BH23 ND, BH21 7610, BH19 27000, BH18 23110 A REPORT OF FINDINGS IS EXPECTED FROM LCS. 5/7/10 LCS SUBMITTED THE PHASE II ENVIRONMENTAL SITE ASSESSMENT FOR 300 OHIO ST. 41 BORINGS WERE ADVANCED. BH36 WAS NOT COMPLETED DUE TO ITS PROXIMITY TO TWO NATURAL GAS UTILITY LINES. A TOTAL OF 197 SOIL SAMPLES WERE COLLECTED FOR GEOLOGIC DESCRIPTION. FILL MATERIAL CONSISTING OF ASPHALT, BRICK, GRAVEL, CLAY, SAND AND SILT WAS NOTED WITHIN ALL OF THE TEST BORINGS WITH THE EXCEPTION OF BH26, BH31 AND BH40 THROUGH BH42 TO A MAXIMUM DEPTH OF APPROX 8 FBGS. GENERALLY, THE NATIVE SOILS ENCOUNTERED CONSISTED OF VARYING MIXTURES OF GRAVEL, SAND, SILT AND CLAY TO THE BOTTOM OF THE TEST BORINGS. APPARENT GW WAS APPROX 4 & 12 FTBGS. EQUIPMENT REFUSAL WAS ENCOUNTERED WITHIN TEST BORING BH7 AT APPROX 8 FTBGS. THE CAUSE OF THE EQUIPMENT REFUSAL COULD NOT BE DETERMINED. PID MEASUREMENTS WERE ABOVE TOTAL AMBIENT AIR BACKGROUND VOC MEASUREMENTS IN 184 OF THE 197 SOIL SAMPLES COLLECTED. THESE ELEVATED CONCENTRATIONS RANGED FROM .1 PPM TO 1897 PPM. PETROLEUM TYPE ODORS WERE DETECTED IN SOIL SAMPLES COLLECTED FROM TEST BORINGS BH1, BH11, BH12, BH15, BH18, BH19, BH23 THROUGH BH29, BH31, BH37, BH38 AND BH41 BETWEEN APPROX THE GROUND SURFACE AND 16 FTBGS. PETROLEUM TYPE STAINING WAS OBSERVED IN SOIL SAMPLES COLLECTED FROM TEST BORINGS BH38 AND BH41 BTW APPROX 4 AND 8 FTBGS. IN LCS' EXPERIENCE, THE PID MEASUREMENTS AND FIELD OBSERVATIONS SUGGEST VOC IMPACT LOCATED WEST SOUTH AND EAST OF THE SUBJECT STRUCTURE. BASED ON THE ANALYTICAL RESULTS, ANALYTES WERE DETECTED AT CONCENTRATIONS ABOVE TAGM RSCO IN SOIL SAMPLES COLLECTED FROM WEST, SOUTH AND EAST OF THE SUBJECT STRUCTURE. ANALYTES WERE NOT DETECTED AT CONCENTRATIONS ABOVE TAGM RSCO'S IN SOIL SAMPLES COLLECTED FROM TEST BORINGS BH15, BH23, BH28, BH29 AND BH40. BASED ON THE FIELD OBSERVATIONS (I.E. ELEVATED PID READINGS, ODORS, STAINING) ANALYTES MAY BE PRESENT IN SOIL SAMPLES COLLECTED FROM THOSE TEST BORINGS; HOWEVER, WERE NOT DETECTED DUE TO ELEVATED LABORATORY METHOD DETECTION LIMITS. CONTAMINATED SOIL AND GW SHOULD BE REMEDIATED IN ACCORDANCE WITH THE REQUIREMENTS OF NYSDEC. NON COMPLIANT UST SYSTEMS SHOULD BE PROPERLY ABANDONED - CLOSED IN PLACE OR EXCAVATED AND REMOVED. 7/26/10 RUSSO, LCS, NATIONAL VAC ON SITE TO CONDUCT ADDITIONAL SUBSURFACE BORINGS ON THE SITE TO DELINEATE THE CONTAMINATION DISCOVERED DURING THE FIRST SUBSURFACE INVESTIGATION. IT IS A CONTINUATION OF THE WORK. NATIONAL VAC IS ON SITE WITH 1 PICK UP TRUCK AND ONE PERSON TO DETERMINE THE CONTENTS OF THE EXISTING USTS. RUSSO AND LCS HAVE BID THE JOB PER DAY AND ARE DRILLING AND DOCUMENTING THE BORINGS AND WILL PROVIDE A REPORT OF FINDINGS. FG ON SITE INSPECTING THE WORK. 7/27/10 RUSSO, LCS, NATIONAL VAC ON SITE TO COMPLETE THE SUBSURFACE INVESTIGATIONS. SAME CREW ON SITE TO COMPLETE THE DELINEATION. 8/27/10 RUSSO SUBMITTED THE LCS 8/25/10 SUPPLEMENTAL PHASE II ENVIRONMENTAL SITE ASSESSMENT LIMITED AND FOCUSED SUBSURFACE SOIL & INVESTIGATION COMPLETED FOR THE SITE. AN ADDITIONAL 24 SOIL BORINGS WERE COMPLETED WITH 22 SOIL SAMPLES SUBMITTED FOR ANALYSIS. THE RESULTS FOR TOTAL STARS LIST VOC'S IN PPB ARE: BH43 18, BH44 ND, BH45 20700, BH46 ND, BH47 ND, BH48 ND, BH50 ND, BH51 1297, BH52 103000, BH53 250900, BH54 636000, BH55 21700, BH56 756, BH58 255600, BH59 ND, BH60 ND, BH61 3800, BH62 4870, BH63 16830, BH64 620, BH65 ND, BH66 ND. THE RESULTS FOR TOTAL STARS LIST SVOC'S IN PPB ARE: BH43

SAM'S TRUCK STOP #110 (Continued) **U003317438**

ND, BH44 17200, BH45 73200, BH46 ND, BH47 10000, BH48 21700, BH50 ND, BH51 ND, BH52 82400, BH53 1400, BH54 ND, BH55 5900, BH56 ND, BH58 13000, BH59 ND, BH60 ND, BH61 ND, BH62 27700, BH63 94000, BH64 21800, BH65 ND, BH66 ND. THE DETECTION LIMITS ON THE ANALYTICAL WERE HIGH WITH A LAB NOTE INDICATING THAT THERE WAS MATRIX INTERFERENCE WITH NO OTHER EXPLANATION. 9/8/10 JOHN LUTTINGER WITH AMEC ON SITE TO COMPLETE THE GPR SURVEY OF THE PROPERTY. THEY WON THE BID SUBMITTED TO THREE PARTIES. THEY WILL PROVIDE A REPORT OF FINDINGS ONCE THEY INTERPRET THE DATA COLLECTED. NATIONAL VAC HAD ONE EMPLOYEE ON SITE WITH A PICK UP TRUCK. 10/3/10 AMEC SUBMITTED THE GEOPHYSICAL SURVEY RESULTS FOR THIS SITE. THE REPORT OVERLAYED A PREVIOUS MAP OF KNOWN TANK LOCATIONS WITH THE GEOPHYSICAL RESULTS. 9 ADDITIONAL LOCATIONS WERE IDENTIFIED AS POSSIBLY HAVING THE PRESENCE OF UST'S ABOVE AND BEYOND THOSE LOCATIONS ALREADY KNOWN TO HAVE UST'S. A COPY OF THE REPORT WAS GIVEN TO MS. TERRI MUCHA, ESQ AND SHE WAS TO PROVIDE IT TO THE OWNER'S ATTORNEY. PETRO USA WILL DECIDE BY FEBRUARY 2011 IF THEY WILL DO THE REMEDIAL WORK NECESSARY OR IF THEY WILL ALLOW THE DEPARTMENT TO COMPLETE THE WORK. 12/14/2010 - GPS: MTG TODAY WITH RICHARD MOORE (ATTORNEY) AND RICK FRAPPA (AMEC CONSULTANTING) REGARDING REMEDIATION OF SITE. FRAPPA PRESENTED PROPOSAL TO CLEAN-UP SITE TO MEET 375 GUIDELEINES WITH TANK PULL, LIMITED EXCAVATION, COVER SYSTEM AND USE RESTRICTIONS. I CLARIFIED THAT THIS ONLY PERTAINED TO BCP PROGRAM AND NOT NAV LAW REQUIREMENTS. NAV LAW REQUIRED PRERELEASE CONDITIONS BE OBTAINED. DISCUSSED REMEDIAL OPTIONS UNDER BCP VS. NAV LAW. PROBLEM WITH BCP IS THAT CORP. TRUSTEES HAVE NO POTENTIAL DEVELOPER TOI TAKE ADVANTAGE OF TAX CREDIT. EST. TANK PULL COSTS AT $50-$80K. THEY THEN SUGGESTED THAT THEY BE ALLOWED TO PULL TANKS AND LEAVE CONTAINATION IN PLACE TO BE ADDRESSED AT A LATER DATE. AGAIN ADVISED THAT THIS WAS NOT POSSIBLE. AGREED THEY WOULD REVEIW OPTIONS WITH TRUSTEES AND RESPOND BACK TO DEC WITH A REMEDIAL PLAN OR ACCESS BY FEB. 1, 2011. 6/2/11 A DEVELOPER PURCHASED THE PROPERTY AND WILL BE SUBMITTING AN APPLICATION TO THE BROWNFIELD PROGRAM. THIS FILE WILL BE CLOSED ONCE THE BROWNFIELD IS APPROVED. 9/16/11 THE BROWNFIELD PROGRAM HAS ACCEPTED THE SITE. THE SPILL FILE IS CLOSED. ALL FURTHER REMEDIAL EFFORTS WILL BE TRACKED IN THE BROWNFIELD PROGRAM."

Remarks: "Former service station with existing USTs and suspected subsurface spill(s). Facility has been listed as a potentia Federal LUST Stimulus project requiring site investigation / remediation. PBS No. 9-38511."

Site Description: Location: The Lehigh Industrial Park site is located at 31 South Street in the City of Lackawanna, Erie County. The site is located in an urban area. Site Features: This site is vacant, grass covered land. It is bordered by train tracks and a rail yard to the east, industrial parcels to the south, the Erie County Sewer District #6 treatment plant to the north, and residential areas to the west. Current Zoning and Land Use: This site is currently vacant, and is zoned for commercial use. Past Use of the Site: This site was

LEHIGH INDUSTRIAL PARK (Continued) **1000554254**

formerly the Roblin Steel Company Scrap Metal Yard and Scrap Processing Facility, until it was acquired by a new owner in 1988. In 1988 DEC investigated a report of a transformer oil spill at this site. They found open and upset transformer casings and several areas of oil drenched soil in, and adjacent to, a small fenced area on the site. PCB contamination of soils was confirmed, with one location showing concentrations of 137,000 ppm of total PCBs. In response to NYSDEC's request, the USEPA conducted further sampling and issued a complaint to the owner. NYSDEC conducted a Remedial Investigation (RI) in 1992. The entire site was fenced at all access points. The RI determined that no migration into residential areas had occurred. The Record of Decision (ROD) was signed in 1994. Remedial Action was completed in 1997 in accordance with the ROD. Remedial activities completed included complete demolition of the abandoned site structures, asbestos abatement, removal and disposal of PCB contaminated soil, on-site consolidation of non-hazardous waste soil and debris, construction of an infiltration basin to control surface water run-off, installation of a clean soil cover over the entire site, and the planting and establishment of a grass cover over the entire site. During construction a total of 212 tons of contaminated soil was disposed of off-site at Modern Landfill in Lewiston, NY. Long-term Operation and Maintenance (O&M) of the site is in progress. The integrity of the clean soil cover over the consolidated fill is being monitored and groundwater quality is being assessed as part of O&M.

Env Problem:	Nature and Extent of Contamination: Prior to Remediation: The RI identified areas of PCB and heavy metals contamination in the wastes and shallow soils. No impacts to shallow groundwater has been observed. Post-Remediation: The site groundwater and cap are being monitored under the Department's long term O&M program
Health Problem:	Residential homes are located north and west of the site. Groundwater is not used as a drinking water source in the vicinity of the landfill. Exposures via drinking water are not expected because public water is supplied to the area. The site is fenced and posted to prevent trespassing and to reduce the potential for exposure. The site remedy which included excavation and off-site disposal of hazardous waste/soil and consolidation and capping of other contamination further reduces the potential for exposure.

They found open and upset transformer casings and several areas of oil drenched soil in, and adjacent to, a small fenced area on the site. PCB contamination of soils was confirmed, with one location showing concentrations of 137,000 ppm of total PCBs. In response to NYSDEC's request, the USEPA conducted further sampling and issued a complaint to the owner. NYSDEC conducted a Remedial Investigation (RI) in 1992. The entire site was fenced at all access points. The RI determined that no migration into residential areas had occurred. The Record of Decision (ROD) was signed in 1994. Remedial Action was completed in 1997 in accordance with the ROD. Remedial activities completed included complete demolition of the abandoned site structures, asbestos abatement, removal and disposal of PCB contaminated soil, on-site consolidation of non-hazardous waste soil and debris, construction of an infiltration basin to control surface water run-off, installation of a clean soil cover over the entire site, and the planting and establishment of a grass cover over the entire site. During construction a total of 212 tons of contaminated soil was disposed of off-site at Modern Landfill in Lewiston, NY. Long-term Operation and Maintenance (O&M) of the site is in progress. The integrity of the clean soil cover over the consolidated fill is being monitored and groundwater quality is being assessed as part of O&M.

Env Problem:	Nature and Extent of Contamination: Prior to Remediation: The RI identified areas of PCB and heavy metals contamination in the wastes and shallow soils. No impacts to shallow groundwater has been observed. Post-Remediation: The site groundwater and cap are being monitored under the Department's long term O&M program
Health Problem:	Residential homes are located north and west of the site. Groundwater is not used as a drinking water source in the vicinity of the landfill. Exposures via drinking water are not expected because public water is supplied to the area. The site is fenced and posted to prevent trespassing and to reduce the potential for exposure. The site remedy which included excavation and off-site disposal of hazardous waste/soil and consolidation and capping of other contamination further reduces the potential for exposure.

LEHIGH INDUSTRIAL PARK (Continued) **1000554254**

Site Description: Location: The Lehigh Industrial Park site is located at 31 South Street in the City of Lackawanna, Erie County. The site is located in an urban area. Site Features: This site is vacant, grass covered land. It is bordered by train tracks and a rail yard to the east, industrial parcels to the south, the Erie County Sewer District #6 treatment plant to the north, and residential areas to the west. Current Zoning and Land Use: This site is currently vacant, and is zoned for commercial use. Past Use of the Site: This site was formerly the Roblin Steel Company Scrap Metal Yard and Scrap Processing Facility, until it was acquired by a new owner in 1988. In 1988 DEC investigated a report of a transformer oil spill at this site. They found open and upset transformer casings and several areas of oil drenched soil in, and adjacent to, a small fenced area on the site. PCB contamination of soils was confirmed, with one location showing concentrations of 137,000 ppm of total PCBs. In response to NYSDEC's request, the USEPA conducted further sampling and issued a complaint to the owner. NYSDEC conducted a Remedial Investigation (RI) in 1992. . Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

FINDS:

Registry ID: 110001141997

Environmental Interest/Information System
AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Tank Info:

Tank Number: 01
Tank Id: 227891
Material Code: 0008
Common Name of Substance: Diesel

Equipment Records:

H02 - Tank Leak Detection - Interstitial - Manual Monitoring
J02 - Dispenser - Suction Dispenser
K00 - Spill Prevention - None
F01 - Pipe External Protection - Painted/Asphalt Coating
G09 - Tank Secondary Containment - Modified Double-Walled (Aboveground)
G10 - Tank Secondary Containment - Impervious Underlayment
A00 - Tank Internal Protection - None

ONTARIO SPECIALITY CONTRACTING, INC. (Continued) **A100326176**

B01 - Tank External Protection - Painted/Asphalt Coating
C01 - Pipe Location - Aboveground
I05 - Overfill - Vent Whistle
D11 - Pipe Type - Flexible Piping
L02 - Piping Leak Detection - Interstitial - Manual Monitoring
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
E07 - Piping Secondary Containment - Trench Liner

Tank Location:	2
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Closed - Removed
Pipe Model:	Not reported
Install Date:	06/01/2008

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE

ONTARIO SPECIALTY CONTRACTING (Continued) **1000202535**

MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR SYNTHETIC MINOR

RCRAInfo is a national information system that supports the Resource

CONAGRA INC (Continued) **1000546190**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was SAC 08/23/00: RMC AND SAC SITE INSPECTION, MET REPRESENTATIVES FROM CITY OF BUFFALO AND THE FIRE DEPT., OWNER OF THE SITE HAD LEFT TOWN A FEW YERS AGO AND CAN NOT BE FOUND, THE FIRE DEPT CONSIDERS THE SITE AN EMERGENCY AND REQUESTED DEC ASSISTANCE TO REMOVE DRUMS WALKED SITE AND THE REPRESENTATIVE FROM THE FIRE DEPT. SHOWED WHERE THE DRUMS WERE. THE CITY HAS ARRANGED FOR EMERGENCY DEMOLITION IN THE AFTERNOON SO THEY REQUESTED DEC TO REMOVE THE DRUMS FROM INSIDE THE BUILDING AS SOON AS POSSIBLE BUT DEFINITELY SOMETIME IN THE AFTERNOON, RMC SAID DEC WOULD ARRANGE TO HAVE DRUMS OVERPACKED AND THEN REMOVED FROM THE BUILDING AND STAGED ON-SITE SAC TELECON TO LINDA SCOTT OF OP-TECH, SHE COULD NOT RESPOND IN THE AFTERNOON, THE NEXT CONTRACTOR, MARCOR, IS LOCATED IN ROCHESTER AND AN IMMEDIATE RESPONSE WAS NECESSARY BECAUSE OF THE NEED FOR THE IMMEDIATE DEMOLITION, SO TRAVEL TIME FROM ROCHESTER MADE MARCOR UNACCEPTABLE AS A CHOICE FOR THIS SPILL CLEANUP SAC TELECON TO THE NEXT CONTRACTOR, THE ENVIRONMENTAL SERVICE GROUP, SAC SPOKE TO BOB LENHART WHO SAID HE WOULD CHECK ON THEIR AVAILABILITY, ABOUT 5 MINUTES LATER SAC RECEIVED A CALL FROM DAVE MENDEL WHO SAID THEY COULD RESPOND IN ABOUT AN HOUR WHICH WAS THE REQUIRED RESPONSE TIME FOR THIS SPILL, THEY ARRIVED ON-SITE A LITTLE AFTER 1300 HRS, AND PROCEEDED TO OVERPACK SEVEN DRUMS AND ARRANGE DISPOSAL FOR ANOTHER AND STAGE THEM ON-SITE, THEY WOULD ALSO SCRAP

RAMCOL FIBRES INC. (Continued) **S104788794**

THE EMPTY DRUMS LEFT ON-SITE SAC TELECON TO THE CITY'S ASSESSORS OFFICE TO CHECK OWNER'S NAME AND MAILING ADDRESS, THE OWNER WAS LISTED AS RAMCOL FIBERS WITH A MAILING ADDRESS OF 226 OHIO STREET, SAC CHECKED FURTHER WITH THE ASSESSOR'S OFFICE AND FOUND OUT THE PROPERTY IS IN ARREARS AND READY FOR FORECLOSURE, THEREFORE NO RP LETTER WILL BE SENT. 08/28/00: SAC RECEIVED WASTE CHARACTERIZATION PROFILE FROM MARK HAGEMAN OF THE ENVIRONMENTAL SERVICE GROUP, BUT THERE WAS NO SAMPLE ANALYSIS SAC TELECON TO MARK HAGEMAN TO BE SURE THIS WAS OK, MR. HAGEMAN SAID THAT IT WAS FIELD TESTED AND BASED ON THE FIELD TESTS AND APPEARANCE OF THE MATERIAL, HE DOES NOT BELIEVE LABORATORY ANALYSIS IS REQUIRED, HE WILL SUBMIT THE PROFILE TO BISON WASTE OIL AND IF THEY HAVE A PROBLEM WITH IT HE WILL ANALYZE A SAMPLE FOR DISPOSAL. 08/30/00: SAC TELECON FROM MARGO OF THE ENVIRONMENTAL SERVICE GROUP, THE DRUMS WILL BE PICKED UP ON FRIDAY FOR DISPOSAL. 10/10/00: SAC PROCESSED PAYMEBNT PACKAGE FROM THE ENVIRONMENTAL SERVICE GROUP, INCLUDES DISPOSAL RECEIPTS. 10/31/00: SAC REVIEWED FILE, APPEARS ALL WORK HAS BEEN COMPLETED, SAC TELECON TO THE ENVIRONMENTAL SERVICE GROUP, NO OTHER INVOICES WILL BE SENT IN, THEY CONFIRMED THAT THE ONE PAYMENT PACKAGE SUBMITTED WAS FOR THE ENTIRE JOB, NO FURTHER WORK REQUIRED."

Remarks: "FIRE DAMAGED VACANT INDUSTRIAL BUILDING, THE BUILDING WAS SCHEDULED FOR EMERGENCY DEMOLITION WHEN DRUMS OF UNKNOWN MATERIAL WERE FOUND"

. Waste name: None

Date form received by agency: 12/31/1996
Site name: COYNE TEXTILE SERVICES
Classification: Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource

COYNE TEXTILE SERVICES (Continued) **1000311792**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Site Code:	56884
Site Description:	Location: The Sovereign Specialty Chemical (Sovereign) VCP Site is a 1.26 acre area that is part of a 6.3-acre active industrial facility (SBL: 122.18-2-2) located at 710 Ohio Street in Buffalo. The site and plant is located in a highly industrialized corridor of the City of Buffalo. Site Features: The site is less than 500’ east of a ship canal which connects to the Buffalo Outer Harbor and approximately 600’ west of the Buffalo River. The site is bounded on the east by CSX railroad tracks, on the west by Ohio St., on the south by the manufacturing portion of the facility, and on the north by Rigidized Metals Corp., a metal processing facility. Current Zoning and Land Use: The site is zoned for industrial purposes. Past Use of the Site: The Sovereign industrial facilities were initially constructed in 1924 and underwent several updates and modifications through the years. An above ground tank farm was constructed in the mid-1960s to store bulk chemicals used in manufacturing of paints and adhesives. The VCP site consists of the footprint of a former tank farm area and partially encompasses a portion of the industrial facility property. Spills and leakages from the tank farm area have lead to on-site

VALSPAR CORP (Continued) **1004761481**

contamination. The site subject to the VCP agreement is currently being managed as single operable unit. Operable Unit 1 (OU1) is the on-site source area. The Sovereign site was owned and operated by the Henkel Corporation. A plant wide Phase 1 and Phase 2 ESA was performed in 1996. The ESAs revealed impacts to soil and groundwater from volatile and semi-volatile organic compounds. A Tank Farm Interim Remedial Measure Plan was undertaken to upgrade Sovereign s tank farm to comply with the standards for new or substantially modified hazardous substance storage facilities under the Chemical Bulk Storage (CBS) regulations. The work was performed as an Interim Remedial Measure under a negotiated consent order and consisted of removal of the existing tank farm, construct a new tank farm to standards in the CBS regulations, excavation of contaminated soil, submitting a workplan for site investigation for the balance of the tank farm area, completing a site investigation, and preparing and implementing, as needed, a Remedial Action Plan (RAP) required for the balance of the tank farm. The tank farm upgrade and initial removal action was completed in 1999. A high vacuum extraction (HVE) system was installed. The HVE system extracted VOC vapors in the soil vadose zone in the contaminated areas and the extracted vapors were treated to remove the VOCs before release. The HVE system included a groundwater treatment component to treat VOC contaminated groundwater. The HVE and groundwater treatment systems were operated and monitored from 2004 to 2010. In March 2010, the NYSDEC approved the request to discontinue the operation of the remedial systems, but required the continuation of the groundwater monitoring program as defined in the Operations, Maintenance and Monitoring plan. The frequency of sampling was limited to annual sampling. The DEC issued a Covenant-Not-to-Sue letter in February 2010. Site Geology and Hydrogeology: The fill is underlain with native soil consisting of silty clay. The depth to the local limestone bedrock was not confirmed. Groundwater is relatively shallow at the site (5 to 7 feet below ground surface). The groundwater gradient is relatively flat. Flow direction is generally toward the west toward Lake Erie. Some variability in the groundwater flow direction has been observed and may be due to local influences from the Buffalo River.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: Based upon investigations to date prior to remediation, the primary contaminants of concern at the site include VOCs (Toluene, Methyl Ethyl Ketone, Xylene, Cyclohexane, Methylcyclohexane, and Toluene). The site contains 6 to 8 feet of industrial fill (slag, cinders, ash, stone and demolition debris). The fill may be the source of low levels of several SVOCs. There is no evidence the contaminated groundwater at the site is impacting the Buffalo River. The western most monitoring well on the site does not indicate any groundwater impacts. Annual conditions and monitoring reports were submitted for operating periods from 2006 through 2008. The results of the sampling and evaluation to assess the effectiveness of the remedial measures reveals that there is has been a reduction in residual VOCs in soil and groundwater at the site. More information regarding the site can be found in the documents placed in the Site Document Repository.

Health Problem: The remedial activities completed at the site have mitigated the potential for exposure.

Site Code: 56884
Site Description: Location: The Sovereign Specialty Chemical (Sovereign) VCP Site is a 1.26 acre area that is part of a 6.3-acre active industrial facility (SBL: 122.18-2-2) located at 710 Ohio Street in Buffalo. The site and plant is located in a highly industrialized corridor of the City of Buffalo. Site Features: The site is less than 500' east of a ship canal which connects to the Buffalo Outer Harbor and approximately 600' west of the Buffalo River. The site is bounded on the east by CSX railroad tracks, on the west by Ohio St., on the south by the manufacturing portion of the facility, and on the north by Rigidized Metals Corp., a metal processing facility. Current Zoning and Land Use: The site is zoned for industrial purposes. Past Use of the Site: The Sovereign industrial facilities were initially constructed in 1924 and underwent several updates and modifications through the years. An above ground tank farm was constructed in the mid-1960s to store bulk chemicals used in manufacturing of paints and adhesives. The VCP site consists of the footprint of a former tank farm area and partially encompasses a portion of the industrial facility property. Spills and leakages from the tank farm area have lead to on-site contamination. The site subject to the VCP agreement is currently being managed as single operable unit. Operable Unit 1 (OU1) is the on-site source area. The Sovereign site was owned and operated by the Henkel Corporation. A plant wide Phase 1 and Phase 2 ESA was performed in 1996. The ESAs revealed impacts to soil and groundwater from volatile and semi-volatile organic compounds. A Tank Farm Interim Remedial Measure Plan was undertaken to upgrade Sovereign s tank farm to comply with the standards for new or substantially modified hazardous substance storage facilities under the Chemical Bulk Storage (CBS) regulations. The work was performed as an Interim Remedial Measure under a negotiated consent order and consisted of removal of the existing tank farm, construct a new tank farm to standards in the CBS regulations, excavation of contaminated soil, submitting a workplan for site investigation for the balance of the tank farm area, completing a site investigation, and preparing and implementing, as needed, a Remedial Action Plan (RAP) required for the balance of the tank farm. The tank farm upgrade and initial removal action was completed in 1999. A high vacuum extraction (HVE) system was installed. The HVE system extracted VOC vapors in the soil vadose zone in the contaminated areas and the extracted vapors were treated to remove the VOCs before release. The HVE system included a groundwater treatment component to treat VOC contaminated groundwater. The HVE and groundwater treatment systems were operated and monitored from 2004 to 2010. In March 2010, the NYSDEC approved the request to discontinue the operation of the remedial systems, but

VALSPAR CORP (Continued) **1004761481**

required the continuation of the groundwater monitoring program as defined in the Operations, Maintenance and Monitoring plan. The frequency of sampling was limited to annual sampling. The DEC issued a Covenant-Not-to-Sue letter in February 2010. Site Geology and Hydrogeology: The fill is underlain with native soil consisting of silty clay. The depth to the local limestone bedrock was not confirmed. Groundwater is relatively shallow at the site (5 to 7 feet below ground surface). The groundwater gradient is relatively flat. Flow direction is generally toward the west toward Lake Erie. Some variability in the groundwater flow direction has been observed and may be due to local influences from the Buffalo River.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: Based upon investigations to date prior to remediation, the primary contaminants of concern at the site include VOCs (Toluene, Methyl Ethyl Ketone, Xylene, Cyclohexane, Methylcyclohexane, and Toluene). The site contains 6 to 8 feet of industrial fill (slag, cinders, ash, stone and demolition debris). The fill may be the source of low levels of several SVOCs. There is no evidence the contaminated groundwater at the site is impacting the Buffalo River. The western most monitoring well on the site does not indicate any groundwater impacts. Annual conditions and monitoring reports were submitted for operating periods from 2006 through 2008. The results of the sampling and evaluation to assess the effectiveness of the remedial measures reveals that there is has been a reduction in residual VOCs in soil and groundwater at the site. More information regarding the site can be found in the documents placed in the Site Document Repository.

Health Problem: The remedial activities completed at the site have mitigated the potential for exposure.

Site Code: 56884
Site Description: Location: The Sovereign Specialty Chemical (Sovereign) VCP Site is a 1.26 acre area that is part of a 6.3-acre active industrial facility (SBL: 122.18-2-2) located at 710 Ohio Street in Buffalo. The site and plant is located in a highly industrialized corridor of the City of Buffalo. Site Features: The site is less than 500' east of a ship canal which connects to the Buffalo Outer Harbor and approximately 600' west of the Buffalo River. The site is bounded on the east by CSX railroad tracks, on the west by Ohio St., on the south by the manufacturing portion of the facility, and on the north by Rigidized Metals Corp., a metal processing facility. Current Zoning and Land Use: The site is zoned for industrial purposes. Past Use of the Site: The Sovereign industrial facilities were initially constructed in 1924 and underwent several updates and modifications through the years. An above ground tank farm was constructed in the mid-1960s to store bulk chemicals used in manufacturing of paints and adhesives. The VCP site consists of the footprint of a former tank farm area and partially encompasses a portion of the industrial facility property. Spills and leakages from the tank farm area have lead to on-site contamination. The site subject to the VCP agreement is currently being managed as single operable unit. Operable Unit 1 (OU1) is the on-site source area. The Sovereign site was owned and operated by the Henkel Corporation. A plant wide Phase 1 and Phase 2 ESA was performed in 1996. The ESAs revealed impacts to soil and groundwater from volatile and semi-volatile organic compounds. A Tank Farm Interim Remedial Measure Plan was undertaken to upgrade Sovereign s tank farm to comply with the standards for new or substantially modified hazardous substance storage facilities under the Chemical Bulk Storage (CBS) regulations. The work was performed as an Interim Remedial Measure under a negotiated consent order and consisted of removal of the existing tank farm, construct a new tank farm to standards in the CBS regulations, excavation of contaminated soil, submitting a workplan for site investigation for the balance of the tank farm area, completing a site investigation, and preparing and implementing, as needed, a Remedial Action Plan (RAP) required for the balance of the tank farm. The tank farm upgrade and initial removal action was completed in 1999. A high vacuum extraction (HVE) system was installed. The HVE system extracted VOC vapors in the soil vadose zone in the contaminated areas and the extracted vapors were treated to remove the VOCs before release. The HVE system included a groundwater treatment component to treat VOC contaminated groundwater. The HVE and groundwater treatment systems were operated and monitored from 2004 to 2010. In March 2010, the NYSDEC approved the request to discontinue the operation of the remedial systems, but required the continuation of the groundwater monitoring program as defined in the Operations, Maintenance and Monitoring plan. The frequency of sampling was limited to annual sampling. The DEC issued a Covenant-Not-to-Sue letter in February 2010. Site Geology and Hydrogeology: The fill is underlain with native soil consisting of silty clay. The depth to the local limestone bedrock was not confirmed. Groundwater is relatively shallow at the site (5 to 7 feet below ground surface). The groundwater gradient is relatively flat. Flow direction is generally toward the west toward Lake Erie. Some

VALSPAR CORP (Continued) **1004761481**

	variability in the groundwater flow direction has been observed and may be due to local influences from the Buffalo River.
Env Problem:	Nature and Extent of Contamination: Prior to Remediation: Based upon investigations to date prior to remediation, the primary contaminants of concern at the site include VOCs (Toluene, Methyl Ethyl Ketone, Xylene, Cyclohexane, Methylcyclohexane, and Toluene). The site contains 6 to 8 feet of industrial fill (slag, cinders, ash, stone and demolition debris). The fill may be the source of low levels of several SVOCs. There is no evidence the contaminated groundwater at the site is impacting the Buffalo River. The western most monitoring well on the site does not indicate any groundwater impacts. Annual conditions and monitoring reports were submitted for operating periods from 2006 through 2008. The results of the sampling and evaluation to assess the effectiveness of the remedial measures reveals that there is has been a reduction in residual VOCs in soil and groundwater at the site. More information regarding the site can be found in the documents placed in the Site Document Repository.
Health Problem:	The remedial activities completed at the site have mitigated the potential for exposure.

Site Code: 56884
Site Description: Location: The Sovereign Specialty Chemical (Sovereign) VCP Site is a 1.26 acre area that is part of a 6.3-acre active industrial facility (SBL: 122.18-2-2) located at 710 Ohio Street in Buffalo. The site and plant is located in a highly industrialized corridor of the City of Buffalo. Site Features: The site is less than 500' east of a ship canal which connects to the Buffalo Outer Harbor and approximately 600' west of the Buffalo River. The site is bounded on the east by CSX railroad tracks, on the west by Ohio St., on the south by the manufacturing portion of the facility, and on the north by Rigidized Metals Corp., a metal processing facility. Current Zoning and Land Use: The site is zoned for industrial purposes. Past Use of the Site: The Sovereign industrial facilities were initially constructed in 1924 and underwent several updates and modifications through the years. An above ground tank farm was constructed in the mid-1960s to store bulk chemicals used in manufacturing of paints and adhesives. The VCP site consists of the footprint of a former tank farm area and partially encompasses a portion of the industrial facility property. Spills and leakages from the tank farm area have lead to on-site contamination. The site subject to the VCP agreement is currently being managed as single operable unit. Operable Unit 1 (OU1) is the on-site source area. The Sovereign site was owned and operated by the Henkel Corporation. A plant wide Phase 1 and Phase 2 ESA was performed in 1996. The ESAs revealed impacts to soil and groundwater from volatile and semi-volatile organic compounds. A Tank Farm Interim Remedial Measure Plan was undertaken to upgrade Sovereign s tank farm to comply with the standards for new or substantially modified hazardous substance storage facilities under the Chemical Bulk Storage (CBS) regulations. The work was performed as an Interim Remedial Measure under a negotiated consent order and consisted of removal of the existing tank farm, construct a new tank farm to standards in the CBS regulations, excavation of contaminated soil, submitting a workplan for site investigation for the balance of the tank farm area, completing a site investigation, and preparing and implementing, as needed, a Remedial Action Plan (RAP) required for the balance of the tank farm. The tank farm upgrade and initial removal action was completed in 1999. A high vacuum extraction (HVE)

VALSPAR CORP (Continued) **1004761481**

system was installed. The HVE system extracted VOC vapors in the soil vadose zone in the contaminated areas and the extracted vapors were treated to remove the VOCs before release. The HVE system included a groundwater treatment component to treat VOC contaminated groundwater. The HVE and groundwater treatment systems were operated and monitored from 2004 to 2010. In March 2010, the NYSDEC approved the request to discontinue the operation of the remedial systems, but required the continuation of the groundwater monitoring program as defined in the Operations, Maintenance and Monitoring plan. The frequency of sampling was limited to annual sampling. The DEC issued a Covenant-Not-to-Sue letter in February 2010. Site Geology and Hydrogeology: The fill is underlain with native soil consisting of silty clay. The depth to the local limestone bedrock was not confirmed. Groundwater is relatively shallow at the site (5 to 7 feet below ground surface). The groundwater gradient is relatively flat. Flow direction is generally toward the west toward Lake Erie. Region: 9
Town: Buffalo (c)
Acres: 1.26
Date Record Added: 11/30/2000
Date Record Updated: 11/15/2017
Updated By: CRSTANIS
Site Description: Location: The Sovereign Specialty Chemical (Sovereign) VCP Site is a 1.26 acre area that is part of a 6.3-acre active industrial facility (SBL: 122.18-2-2) located at 710 Ohio Street in Buffalo. The site and plant is located in a highly industrialized corridor of the City of Buffalo. Site Features: The site is less than 500' east of a ship canal which connects to the Buffalo Outer Harbor and approximately 600' west of the Buffalo River. The site is bounded on the east by CSX railroad tracks, on the west by Ohio St., on the south by the manufacturing portion of the facility, and on the north by Rigidized Metals Corp., a metal processing facility. Current Zoning and Land Use: The site is zoned for industrial purposes. Past Use of the Site: The Sovereign industrial facilities were initially constructed in 1924 and underwent several updates and modifications through the years. An above ground tank farm was constructed in the mid-1960s to store bulk chemicals used in manufacturing of paints and adhesives. The VCP site consists of the footprint of a former tank farm area and partially encompasses a portion of the industrial facility property. Spills and leakages from the tank farm area have lead to on-site contamination. The site subject to the VCP agreement is currently being managed as single operable unit. Operable Unit 1 (OU1) is the on-site source area. The Sovereign site was owned and operated by the Henkel Corporation. A plant wide Phase 1 and Phase 2 ESA was performed in 1996. The ESAs revealed impacts to soil and groundwater from volatile and semi-volatile organic compounds. A Tank Farm Interim Remedial Measure Plan was undertaken to upgrade Sovereign s tank farm to comply with the standards for new or substantially modified hazardous substance storage facilities under the Chemical Bulk Storage (CBS) regulations. The work was performed as an Interim Remedial Measure under a negotiated consent order and consisted of removal of the existing tank farm, construct a new tank farm to standards in the CBS regulations, excavation of contaminated soil, submitting a workplan for site investigation for the balance of the tank farm area, completing a site investigation, and preparing and implementing, as needed, a Remedial Action Plan (RAP) required for the balance of the tank farm. The tank farm upgrade and initial removal action was completed in 1999. A high vacuum extraction (HVE) system was installed. The HVE system extracted VOC vapors in the soil vadose zone in the contaminated areas and the extracted vapors were treated to remove the VOCs before release. The HVE system included a groundwater treatment component to treat VOC contaminated groundwater. The HVE and groundwater treatment systems were operated and monitored from 2004 to 2010. In March 2010, the NYSDEC approved

VALSPAR CORP (Continued) **1004761481**

	the request to discontinue the operation of the remedial systems, but required the continuation of the groundwater monitoring program as defined in the Operations, Maintenance and Monitoring plan. The frequency of sampling was limited to annual sampling. The DEC issued a Covenant-Not-to-Sue letter in February 2010. Site Geology and Hydrogeology: The fill is underlain with native soil consisting of silty clay. The depth to the local limestone bedrock was not confirmed. Groundwater is relatively shallow at the site (5 to 7 feet below ground surface). The groundwater gradient is relatively flat. Flow direction is generally toward the west toward Lake Erie. Some variability in the groundwater flow direction has been observed and may be due to local influences from the Buffalo River.
Env Problem:	Nature and Extent of Contamination: Prior to Remediation: Based upon investigations to date prior to remediation, the primary contaminants of concern at the site include VOCs (Toluene, Methyl Ethyl Ketone, Xylene, Cyclohexane, Methylcyclohexane, and Toluene). The site contains 6 to 8 feet of industrial fill (slag, cinders, ash, stone and demolition debris). The fill may be the source of low levels of several SVOCs. There is no evidence the contaminated groundwater at the site is impacting the Buffalo River. The western most monitoring well on the site does not indicate any groundwater impacts. Annual conditions and monitoring reports were submitted for operating periods from 2006 through 2008. The results of the sampling and evaluation to assess the effectiveness of the remedial measures reveals that there is has been a reduction in residual VOCs in soil and groundwater at the site. More information regarding the site can be found in the documents placed in the Site Document Repository.
Health Problem:	The remedial activities completed at the site have mitigated the potential for exposure.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: Location: The Radio Tower Area is located near Lake Erie and the Buffalo Outer Harbor, in the southeast corner of a larger, 212-acre parcel of waterfront land owned by the Niagara Frontier Transportation Authority (NFTA). The site is located in an urban area. Site Features: The majority of the NFTA's Buffalo Outer Harbor property is reclaimed land, created primarily with sediments dredged from the harbor shipping channels over a 100-year period ending in the mid 1960s. The southern end of the NFTA property is occupied by the NFTA's port terminal facilities, consisting of two warehouses and large, paved parking areas. The Radio Tower Area is situated near the northern edge of the terminal parking area. The remainder of the NFTA property to the north of the site is vacant land. The environmental restoration project known as the Greenbelt (Site #B00149) is located along the harbor shoreline approximately 1000 feet northwest of the the Radio Tower Area. Fuhrmann Boulevard and NY State Route 5 are located several hundred feet to the east of the Radio Tower Area, along the eastern border of the NFTA property. Current Zoning and Land Use: This site is zoned for commercial use. Past Use of the Site: A 1998 Remedial Investigation conducted by NYSDEC found that the most significantly contaminated portion of the NFTA Outer Harbor property was located near a radio tower at the southern end of the property. Records indicated that hazardous waste from a local chemical dye manufacturer were disposed in this portion of the property; concentrations of nitrobenzene found in the soils here exceeded TCLP hazardous waste thresholds. The site originally included a 6-acre parcel referred to as the Radio Tower Area. A Record of Decision (ROD) for the Radio Tower Area was issued in 1999,

BUFFALO OUTER HARBOR-RADIO TOWER AREA (Continued) **S118950586**

calling for the ex-situ bioremediation of the nitrobenzene-contaminated soils. In 2001, the responsible party completed a pilot study of an in-situ chemical oxidation treatment of soils as an alternative to the ROD. An Explanation of Significant Difference to the ROD was issued in 2003, accepting the in-situ chemical oxidation remedy for the Radio Tower Area. A design investigation was initiated in late 2002 to further delineate the area of soil requiring treatment. The boundaries of the site, the area subject to deed restrictions and long term management, were later redefined to encompass sample locations where the residual subsurface soil/fill concentrations of nitrobenzene exceeded 1 mg/kg, an area measuring approximately 0.9 acres. Remedial action was initiated in 2003 and consisted of two rounds of in situ chemical oxidation treatments using potassium permanganate. Additional treatability studies were conducted and a stabilizing mixture of Portland cement and activated carbon was determined to be effective in reducing the leachability of the remaining nitrobenzene. In-situ stabilization activities were completed in 2003. The addition of the cement and activated carbon created a mound of treated soils approximately 7 feet above the surrounding ground surface. The final site restoration activities, completed in 2004, consisted of the excavation of the mounded, excess treated/stabilized soils to ground surface and transport of that excavated material to the nearby Alltift Landfill site (#915054). Here the material was used to stabilize similarly contaminated sediments and soils, in conjunction with an ongoing NYSDEC-approved site remediation. Approximately 1680 cubic yards of treated, stabilized soil was taken to the Alltift landfill site. The treated soils remaining at the Radio Tower Area were covered with two feet of clean fill and topsoil over a demarcation layer of geotextile fabric. Deed restrictions were filed in 2005 limiting the site to industrial or commercial usage. A Site Management Plan was put in place requiring annual inspection and maintenance of the soil cover.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: The primary contaminant of concern at the site was nitrobenzene in the soil. The completed remedial action has treated and stabilized the soils and is not having an impact on groundwater quality. Groundwater samples were also obtained from a number of wells located throughout the Buffalo Outer Harbor property. Groundwater sample results from areas outside the RTA contained low levels of metals and some wells exhibited low levels of SVOC compounds above the Class GA groundwater standards. Due to the limited migration of groundwater contamination and the low permeability of the fill material, the chemical loading to the Lake is minimal. Post-Remediation: Sampling of the surface waters of Lake Erie concluded that there are no present impacts to water quality from the Buffalo Outer Harbor property. Remediation at the site is complete.

Health Problem: Drinking contaminated water is not expected because the area is served by a public water supply system. The contaminated soil in the vicinity of the Radio Tower has been remediated. In the event of development outside the Radio Tower Area, the State recommends that the developer and municipal authorities ensure elimination of exposure routes that would be created by increased land use.

Site Description:	Location: The Radio Tower Area is located near Lake Erie and the Buffalo Outer Harbor, in the southeast corner of a larger, 212-acre parcel of waterfront land owned by the Niagara Frontier Transportation Authority (NFTA). The site is located in an urban area. Site Features: The majority of the NFTA's Buffalo Outer Harbor property is reclaimed land, created primarily with sediments dredged from the harbor shipping channels over a 100-year period ending in the mid 1960s. The southern end of the NFTA property is occupied by the NFTA's port terminal facilities, consisting of two warehouses and

NIAGARA FRONTIER PORT AUTHORITY (Continued) **1000232780**

large, paved parking areas. The Radio Tower Area is situated near the northern edge of the terminal parking area. The remainder of the NFTA property to the north of the site is vacant land. The environmental restoration project known as the Greenbelt (Site #B00149) is located along the harbor shoreline approximately 1000 feet northwest of the the Radio Tower Area. Fuhrmann Boulevard and NY State Route 5 are located several hundred feet to the east of the Radio Tower Area, along the eastern border of the NFTA property. Current Zoning and Land Use: This site is zoned for commercial use. Past Use of the Site: A 1998 Remedial Investigation conducted by NYSDEC found that the most significantly contaminated portion of the NFTA Outer Harbor property was located near a radio tower at the southern end of the property. Records indicated that hazardous waste from a local chemical dye manufacturer were disposed in this portion of the property; concentrations of nitrobenzene found in the soils here exceeded TCLP hazardous waste thresholds. The site originally included a 6-acre parcel referred to as the Radio Tower Area. A Record of Decision (ROD) for the Radio Tower Area was issued in 1999, calling for the ex-situ bioremediation of the nitrobenzene-contaminated soils. In 2001, the responsible party completed a pilot study of an in-situ chemical oxidation treatment of soils as an alternative to the ROD. An Explanation of Significant Difference to the ROD was issued in 2003, accepting the in-situ chemical oxidation remedy for the Radio Tower Area. A design investigation was initiated in late 2002 to further delineate the area of soil requiring treatment. The boundaries of the site, the area subject to deed restrictions and long term management, were later redefined to encompass sample locations where the residual subsurface soil/fill concentrations of nitrobenzene exceeded 1 mg/kg, an area measuring approximately 0.9 acres. Remedial action was initiated in 2003 and consisted of two rounds of in situ chemical oxidation treatments using potassium permanganate. Additional treatability studies were conducted and a stabilizing mixture of Portland cement and activated carbon was determined to be effective in reducing the leachability of the remaining nitrobenzene. In-situ stabilization activities were completed in 2003. The addition of the cement and activated carbon created a mound of treated soils approximately 7 feet above the surrounding ground surface. The final site restoration activities, completed in 2004, consisted of the excavation of the mounded, excess treated/stabilized soils to ground surface and transport of that excavated material to the nearby Alltift Landfill site (#915054). Here the material was used to stabilize similarly contaminated sediments and soils, in conjunction with an ongoing NYSDEC-approved site remediation. Approximately 1680 cubic yards of treated, stabilized soil was taken to the Alltift landfill site. The treated soils remaining at the Radio Tower Area were covered with two feet of clean fill and topsoil over a demarcation layer of geotextile fabric. Deed restrictions were filed in 2005 limiting the site to industrial or commercial usage. A Site Management Plan was put in place requiring annual inspection and maintenance of the soil cover.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: The primary contaminant of concern at the site was nitrobenzene in the soil. The completed remedial action has treated and stabilized the soils and is not having an impact on groundwater quality. Groundwater samples were also obtained from a number of wells located throughout the Buffalo Outer Harbor property. Groundwater sample results from areas outside

NIAGARA FRONTIER PORT AUTHORITY (Continued) **1000232780**

	the RTA contained low levels of metals and some wells exhibited low levels of SVOC compounds above the Class GA groundwater standards. Due to the limited migration of groundwater contamination and the low permeability of the fill material, the chemical loading to the Lake is minimal. Post-Remediation: Sampling of the surface waters of Lake Erie concluded that there are no present impacts to water quality from the Buffalo Outer Harbor property. Remediation at the site is complete.
Health Problem:	Drinking contaminated water is not expected because the area is served by a public water supply system. The contaminated soil in the vicinity of the Radio Tower has been remediated. In the event of development outside the Radio Tower Area, the State recommends that the developer and municipal authorities ensure elimination of exposure routes that would be created by increased land use.

Site Code: 56556
Site Description: Location: The Radio Tower Area is located near Lake Erie and the Buffalo Outer Harbor, in the southeast corner of a larger, 212-acre parcel of waterfront land owned by the Niagara Frontier Transportation Authority (NFTA). The site is located in an urban area. Site Features: The majority of the NFTA's Buffalo Outer Harbor property is reclaimed land, created primarily with sediments dredged from the harbor shipping channels over a 100-year period ending in the mid 1960s. The southern end of the NFTA property is occupied by the NFTA's port terminal facilities, consisting of two warehouses and large, paved parking areas. The Radio Tower Area is situated near the northern edge of the terminal parking area. The remainder of the NFTA property to the north of the site is vacant land. The environmental restoration project known as the Greenbelt (Site #B00149) is located along the harbor shoreline approximately 1000 feet northwest of the the Radio Tower Area. Fuhrmann Boulevard and NY State Route 5 are located several hundred feet to the east of the Radio Tower Area, along the eastern border of the NFTA property. Current Zoning and Land Use: This site is zoned for commercial use. Past Use of the

NIAGARA FRONTIER PORT AUTHORITY (Continued) **1000232780**

Site: A 1998 Remedial Investigation conducted by NYSDEC found that the most significantly contaminated portion of the NFTA Outer Harbor property was located near a radio tower at the southern end of the property. Records indicated that hazardous waste from a local chemical dye manufacturer were disposed in this portion of the property; concentrations of nitrobenzene found in the soils here exceeded TCLP hazardous waste thresholds. The site originally included a 6-acre parcel referred to as the Radio Tower Area. A Record of Decision (ROD) for the Radio Tower Area was issued in 1999, calling for the ex-situ bioremediation of the nitrobenzene-contaminated soils. In 2001, the responsible party completed a pilot study of an in-situ chemical oxidation treatment of soils as an alternative to the ROD. An Explanation of Significant Difference to the ROD was issued in 2003, accepting the in-situ chemical oxidation remedy for the Radio Tower Area. A design investigation was initiated in late 2002 to further delineate the area of soil requiring treatment. The boundaries of the site, the area subject to deed restrictions and long term management, were later redefined to encompass sample locations where the residual subsurface soil/fill concentrations of nitrobenzene exceeded 1 mg/kg, an area measuring approximately 0.9 acres. Remedial action was initiated in 2003 and consisted of two rounds of in situ chemical oxidation treatments using potassium permanganate. Additional treatability studies were conducted and a stabilizing mixture of Portland cement and activated carbon was determined to be effective in reducing the leachability of the remaining nitrobenzene. In-situ stabilization activities were completed in 2003. The addition of the cement and activated carbon created a mound of treated soils approximately 7 feet above the surrounding ground surface. The final site restoration activities, completed in 2004, consisted of the excavation of the mounded, excess treated/stabilized soils to ground surface and transport of that excavated material to the nearby Alltift Landfill site (#915054). Here the material was used to stabilize similarly contaminated sediments and soils, in conjunction with an ongoing NYSDEC-approved site remediation. Approximately 1680 cubic yards of treated, stabilized soil was taken to the Alltift landfill site. The treated soils remaining at the Radio Tower Area were covered with two feet of clean fill and topsoil over a demarcation layer of geotextile fabric. Deed restrictions were filed in 2005 limiting the site to industrial or commercial usage. A Site Management Plan was put in place requiring annual inspection and maintenance of the soil cover.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: The primary contaminant of concern at the site was nitrobenzene in the soil. The completed remedial action has treated and stabilized the soils and is not having an impact on groundwater quality. Groundwater samples were also obtained from a number of wells located throughout the Buffalo Outer Harbor property. Groundwater sample results from areas outside the RTA contained low levels of metals and some wells exhibited low levels of SVOC compounds above the Class GA groundwater standards. Due to the limited migration of groundwater contamination and the low permeability of the fill material, the chemical loading to the Lake is minimal. Post-Remediation: Sampling of the surface waters of Lake Erie concluded that there are no present impacts to water quality from the Buffalo Outer Harbor property. Remediation at the site is complete.

Health Problem: Drinking contaminated water is not expected because the area is

NIAGARA FRONTIER PORT AUTHORITY (Continued) **1000232780**

served by a public water supply system. The contaminated soil in the vicinity of the Radio Tower has been remediated. In the event of development outside the Radio Tower Area, the State recommends that the developer and municipal authorities ensure elimination of exposure routes that would be created by increased land use.

DEC Memo:	"08/28/06 JFO ON SITE MET WITH BRIAN WITH ENV SRV GROUP. THE SOUTH SIDEWALL SAMPLE RESULT (8270)CAME BACK SLIGHTLY ABOVE TAGMS. THEY WANT A CLEAN CLOSURE SO THEY WILL REMOVE SOIL AND RESAMPLE FOR THE SVOC'S. THE SOIL WENT TO THE TONAWANDA LANDFILL (ENSOL). 08/30/06 JFO CALL TO ADAM H. HE WILL FORWARD THE RESULTS AND THE RECEIPTS. 10/26/06 JFO CALL TO ADAM. LEFT A MESSAGE ON HIS VMAIL. NEED RECEIPTS AND RESULTS OF RESAMPLING. 12/07/06 JFO CALL TO ADAM H. HE SAID THE SOIL WAS CLEAN AND IT WENT OUT AS CLEAN. HE USED THE PID TO DETERMINE THE SOIL WAS CLEAN. I CALLED ENSOL AND SPOKE WITH NICK MORREALE, HE WILL FIND OUT WHERE THE SOIL WENT AND GET BACK TO ME. I ALSO CALLED BILL MOSS WITH THE BOARD OF ED. HE WAS NOT IN, I LEFT A MESSAGE ON HIS V-MAIL. 02/21/07 JFO RECEIVED THE CLOSURE REPORT AND AN EXPLANATION FROM ADAM HARRIS. INCLUDED ARE THE DISPOSAL RECEIPTS FOR THE TANK BOTTOMS, THE PID READINGS FROM THE SOILS THAT WERE REMOVED AND THE SECOND SOUTH WALL SAMPLE RESULT FOR 8270. ALL COMPOUNDS ARE BELOW DETECTION. THE SOILS THAT WERE REMOVED WERE FREE OF CONTAMINATION AND WERE USED AS INTERIM COVER AT TONAWANDA LANDFILL. NO FURTHER ACTION REQUIRED. CLOSED"
Remarks:	"SAMPLE RESULTS FROM A TANK PULL INDICATE CONTAMINATION."

Contact Name:	DERRICK JOHNSON
DEC Memo:	"9/19/2011: RJJ AT SITE AT 0800...A LARGE FIRE STARTED ABOUT 0400 THIS MORNING,AT THE GERDOU AMERISTEEL RECYCLING FACILITY(FROM AN UNKNOWN CAUSE) WHICH CAUSED A LARGE BLACK PLUME OF SMOKE THROUGHOUT THE NEARBY AREA...THIS FIRE WAS CONTAINED IN THE AREA WHERE THEY STACK THEIR CRUSHED VEHICLES,NEAR THE BACK OF THEIR FACILITY...NO ONE WAS INJURED AND NO BUILDINGS WERE AFFECTED,EXCEPT FOR THE LARGE AMOUNT OF BLACK SOOT WHICH SPREAD THROUGHOUT THE COMMUNITY...THE BUFFALO FIRE DEPT. RESPONDED AND CONTAINED THE FIRE IN THIS SMALL AREA...WITH THE LARGE AMOUNT OF WATER USED,IT CAUSED A LARGE RUNOFF OF WATER INTO THE BUFFALO RIVER,BEHIND THEIR FACILITY(~200 YARDS FROM THE FIRE)...THIS RUNOFF THEN DISCHARGES INTO THEIR STORM WATER OUTFALL AND IT APPEARS TO HAVE NO PETROLEUM SHEEN OF ANY KIND SO NO ENVIRONMENTAL CLEAN-UP IS NEEDED IN THE BUFFALO RIVER AT THIS TIME,HOWEVER,THERE IS A SLIGHT PETROLEUM SHEEN,IN A FEW AREAS,ON THEIR PROPERTY,SO I INFORMED RON TIMM(PLANT SUPERVISOR) THAT THEY WILL NEED TO PLACE ABSORBANT PADS/BOOMS TO CONTAIN/CAPTURE THIS SHEEN...HE SAID THAT THEY WILL AND KEEP ME INFORMED IF ANYTHING CHANGES...I WILL REINSPECT,IF NEEDED...DERRICK JOHNSON(LOCATION MANAGER) TELECON RJJ AT 1400,HE SAID THAT THEY ARE STILL SPRAYING WATER ON THE HOT SPOTS,HOWEVER,THEY ONLY OBSERVED A SLIGHT PETROLEUM SHEEN IN A FEW AREAS ON THE PROPERTY,WHERE I ALSO OBSERVED IT...THEY WILL USE ABSORBANTS TO CLEAN UP THE SHEEN AND DISPOSE ALL THE MATERIAL,THEN DERRICK WILL SEND ME THE DISPOSAL RECEIPTS. 9/20/2011: DERRICK JOHNSON TELECON RJJ,HE SAID THAT THEY INSPECTED THE BUFFALO RIVER AND ALL THEIR PROPERTY AND FOUND NO PETROLEUM SHEEN OF ANY KIND. 12/7/2011: RECEIVED THE SPILL INCIDENT REPORT FROM GERDAU WHICH EXPLAINS THEIR ACTIONS...SINCE THERE WAS ONLY A VERY SLIGHT SHEEN ON THE PROPERTY,THE ABSORBANT BOOMS DID NOT PICK-UP ANY PRODUCT,SO THEY WILL BE RE-USED,SO THERE IS NO DISPOSAL OF ANY MATERIAL...AFTER REVIEWING THIS SPILL FILE,SAC SAID THAT WE CAN CLOSE-OUT THIS SPILL...NO FURTHER ACTION NEEDED...SPILL CLOSED OUT."
Remarks:	"FD at large rubbish fire in recycling yard and material is running into the Buffalo River. Coast Guard is expressing concern and FD is requesting a response."

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

AIR MINOR

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when

ADVANCE METALS RECYCLING (Continued) **1000872146**

complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Record Add:	11/18/1999
Record Upd:	02/15/2013
Updated By:	MLDOSTER
Site Description:	Mollenberg-Betz used this site to steam clean commercial refrigeration equipment. The washings, consisting of oil, grease and dirt, were permitted to flow directly into the ground. Waste oil was also spread on a parking lot for dust control. The company abandoned the steam cleaning operation in 1978. Erie County prepared a site profile report in 1982. A Phase I Investigation has been completed. Soil sampling taken by NYSDEC in 1989 did not find contaminants at levels of concern. The disposal of hazardous waste can not be documented at this site.
Env Problem:	No environmental problems have been noted at this site.
Health Problem:	The site is located in a mixed residential and industrial area along Scott Street in South Buffalo. Washings from a steam cleaning operation were formerly disposed of by direct discharge to the ground outside of the plant building. Waste oils were also spread over a gravel parking lot for dust control. This area is now paved with asphalt. No environmental monitoring data is available for this site. It is likely that any contamination which may exist in the soils is directly under the disposal area. Contamination of the underlying groundwater is possible. No wells in the area are used for drinking water. Public water supply services the area. No significant pathways for human exposure have been identified at the site.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/17/2018

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/17/2018

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory
The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Northwest Map:	5938774 BUFFALO NW, NY
Version Date:	2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

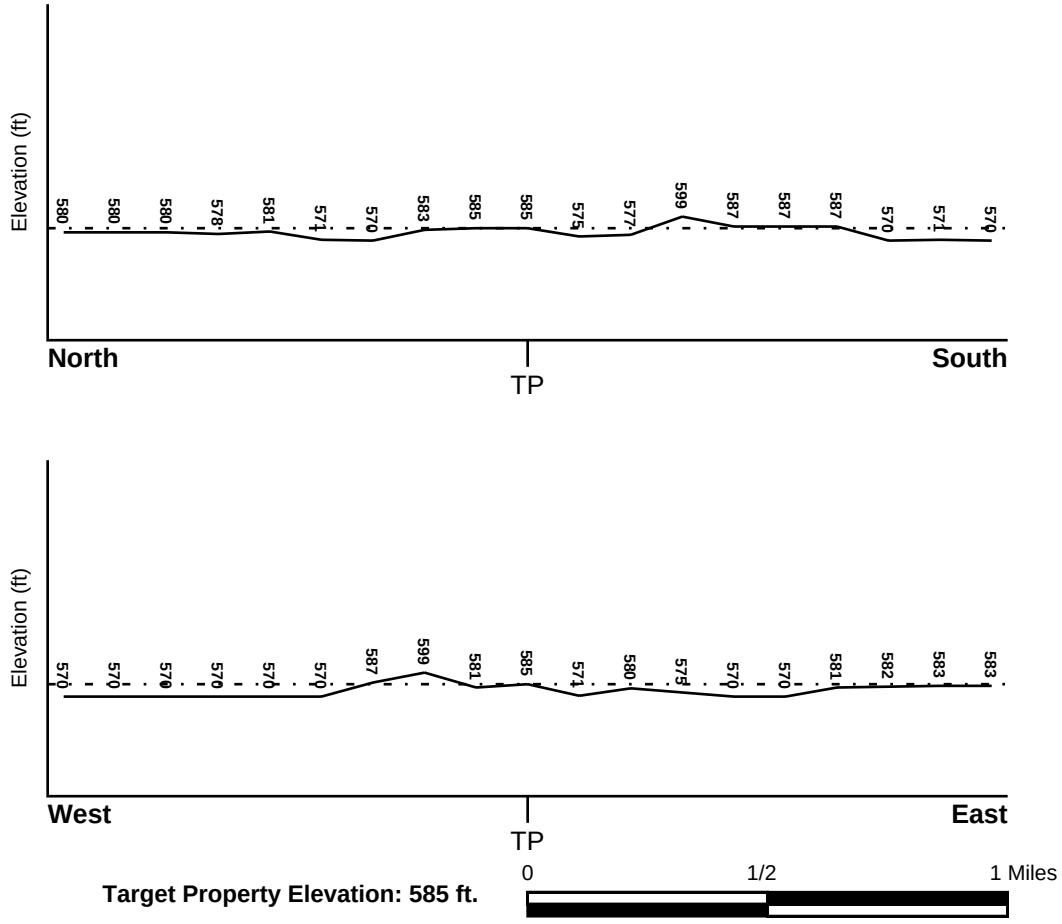
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ENE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
36029C0326G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
3602300020B	FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
BUFFALO SE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: Water

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: Urban

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 31 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Dear Mr. Cooper:

Contaminated Soil
Lake Erie Transportation
Buffalo
Erie County

Based on my site investigation at the above-referenced location on January 5, 1988, no contamination of groundwater or soil exists that requires cleanup.

I hope this satisfies your request. Please contact me at 847-4586 if you have any further questions or concerns.

Sincerely,

James D. Cooke

Attn: John F. Otto, E.E.T-I.
Bulk Storage Unit - Region 9

Subject: G.W. Burnett, Inc. - Bulk Storage Compliance

Dear Mr. Otto:

Please be advised that G.W. Burnett, Inc. has enlisted Lancaster Tanks and Steel Products of Lancaster, New York to install a portable above ground, diked fuel storage tank. Delivery and installation of this tank could be as quick as 4-6 weeks from now, however, the order cannot be sealed until we are fully aware of any restrictions placed on the tank specifications caused by the City of Buffalo ordinance. My understanding is that the Buffalo Fire Department is to furnish me with those ordinances. We anxiously await

Manifest 122057

NON-HAZARDOUS RESIDUAL WASTE MANIFEST

GENERATOR INFORMATION

1. Generator of Waste (must be filled in by Generator): G.W. BURNETT INC.

Company Address: 145 (number) GANSON ST. (street) BUFFALO (city) N.Y. (state) 14203 (zip code)

Pick-up Address: 189 (number) GANSON ST. (street) BUFFALO (city) N.Y. (state) 14203 (zip code)

Generator Telephone Number: 716-856-8300

Name of Waste: CONTAMINATED SOIL

This manifest represents a non-hazardous waste as per E.P.A. and Pennsylvania D.E.R. regulations.

Estimated Tons: 22 Tons Special handling instructions, if any:

This is to certify that the above named material is properly classified, described, packaged, marked, and labeled is in proper condition for transportation according to applicable state and federal law. The waste was consigned to the transporter named below. I certify that the foregoing is true and correct to the best of my knowledge.

Signature: E. J. Burnett V.P. (Name and Title) Date: 5-20-97

TRANSPORTER INFORMATION

2. Hauler of Waste (must be filled in by Hauler): BROWN'S GENERAL DUMP TRUCK SER. INC

Hauler Address: 3340 (number) NORTH BENZING RD. (street) ORCHARD PARK (city) NY (state) 14127 (zip code)

Pick-up Date: 5-20-97 Truck Number: B-12 Vehicle License Number:

The above described waste was picked up and hauled by me to the disposal facility named below. I certify that the foregoing is true and correct to the best of my knowledge.

Driver Signature: Kevin Hewitt (Name and Title) Date: 5-20-97

DISPOSAL SITE INFORMATION

3. Company Name: Lake View Landfill

Disposal Site Location: 851 Robison Road, East, Erie, PA 16509

Waste subject to this manifest was delivered by the above hauler to this disposal facility and was accepted, except as noted in the discrepancy indication space below.

Disposal Date: 5/20/97 Total Tons: 17.43

Discrepancy Indication Space:

Signature of authorized agent: [illegible] (Name and Title)

White - Landfill Canary - Generator Final Pink - Hauler Goldenrod - Generator Original

APPLICATION FOR ACCESS TO RECORDS

(See Instructions on Reverse Side)

APPLICANT

- TO THE DEPARTMENT OF ENVIRONMENTAL CONSERVATION:
I hereby apply to inspect the following records under the provisions of the Freedom of Information Law:

Spill File # 9501488

After inspection, should I desire copies of all or part of the records inspected, I will identify the records to be copied and hereby offer to promptly pay the established fees. (Cost of reproduction or 25¢ per page as applicable). Contact me if cost will exceed $ _____.

Name (Print or type) Joe Allen Telephone No. 800-352-0050

Attention of: _____

Mailing Address 3530 Post Rd Southport, CT

Signature _____ Date 10-26-99

RECORDS CUSTODIAN

- TO THE APPLICANT:

—Records Provided

☐ The reproduction costs for the records provided are $ _____

☐ Records have been (partially, fully) provided. (If not fully provided, date when records are expected to be fully provided: _____)

—Records Not Available

☐ Records cannot be found after diligent search

☐ The Department is not the custodian for records indicated

—Records Denied

I hereby certify that access to the records—or part of the records—circled above has been denied to the applicant for the reason(s) checked below:

☐ Specifically exempt by other statute

☐ Unwarranted invasion of personal privacy

☐ Would impair present or imminent contract awards or collective bargaining negotations

☐ Are examination questions or answers

☐ Are inter-agency or intra-agency materials that are not:
- statistical or factual tabulations or data
- instructions to staff that affect the public
- final agency policy or determinations; or
- external audits, including but not limited to audits performed by the comptroller and the federal government

☐ Would endanger the life or safety of any person

☐ Are compiled for law enforcement purposes and which, if disclosed would:
- interfere with law enforcement investigations or judicial proceedings
- deprive a person of the right to a fair trial or impartial adjudication
- identify a confidential source or disclose confidential information relating to a criminal investigation, or
- reveal criminal investigative techniques or procedures, except routine techniques and procedures

☐ Are computer access codes

☐ Are trade secrets

Identification of records withheld (attach listing if additional space is required) and/or explanation if appropriate:

Mr. John Minichiello
Environmental Engineering Manager
Waste Management
425 Perinton Parkway
Fairport, New York 14450

Dear Mr. Minichiello:

Spill Number 9501488
191 Ganson Street
Buffalo
Erie County

We have reviewed the analytical results for the excavation samples from the above-referenced site. The results exceed our soil guidance values. However, since the results were low levels, we will not require any further work at this time. The site will have a status of "inactive".

Your cooperation is appreciated. If you have any questions, please call Mr. Robert Crossen of this office at (716) 851-7220.

Sincerely,

Salvatore A. Calandra

Re: Remedial Investigations WMNY - Ganson Street Property

Dear Mr. Crossen:

Enclosed with this letter is a copy of the Soil and Sediment Remediation Report that has been generated as part of an environmental assessment that was perform at the former Waste Management of New York, Inc. hauling division property on Ganson Street in Buffalo, N.Y. The enclosed remediation report represents the completion of remedial activities regarding the removal of petroleum impacted soils and sediments as part of a purchase and sale agreement, where WMNY was selling the Ganson Street property to another party.

The remedial reports documents the results of the remedial effort that was performed in accordance with the April 6, 1995, Remedial Action Plan Soil Investigation Report. All areas where chemical constituents had been identified were removed and identified as clean by AFI personnel. The results of composite samples taken from the excavation and removal areas show that the areas of interest were cleaned up to background levels or lower for all chemical constituents.

Please feel free to contact me at our Fairport, NY, location, indicated below, should you have any questions or comments regarding this matter. Thank-you.

Sincerely,

John A. Minichiello
Environmental Engineering Manager

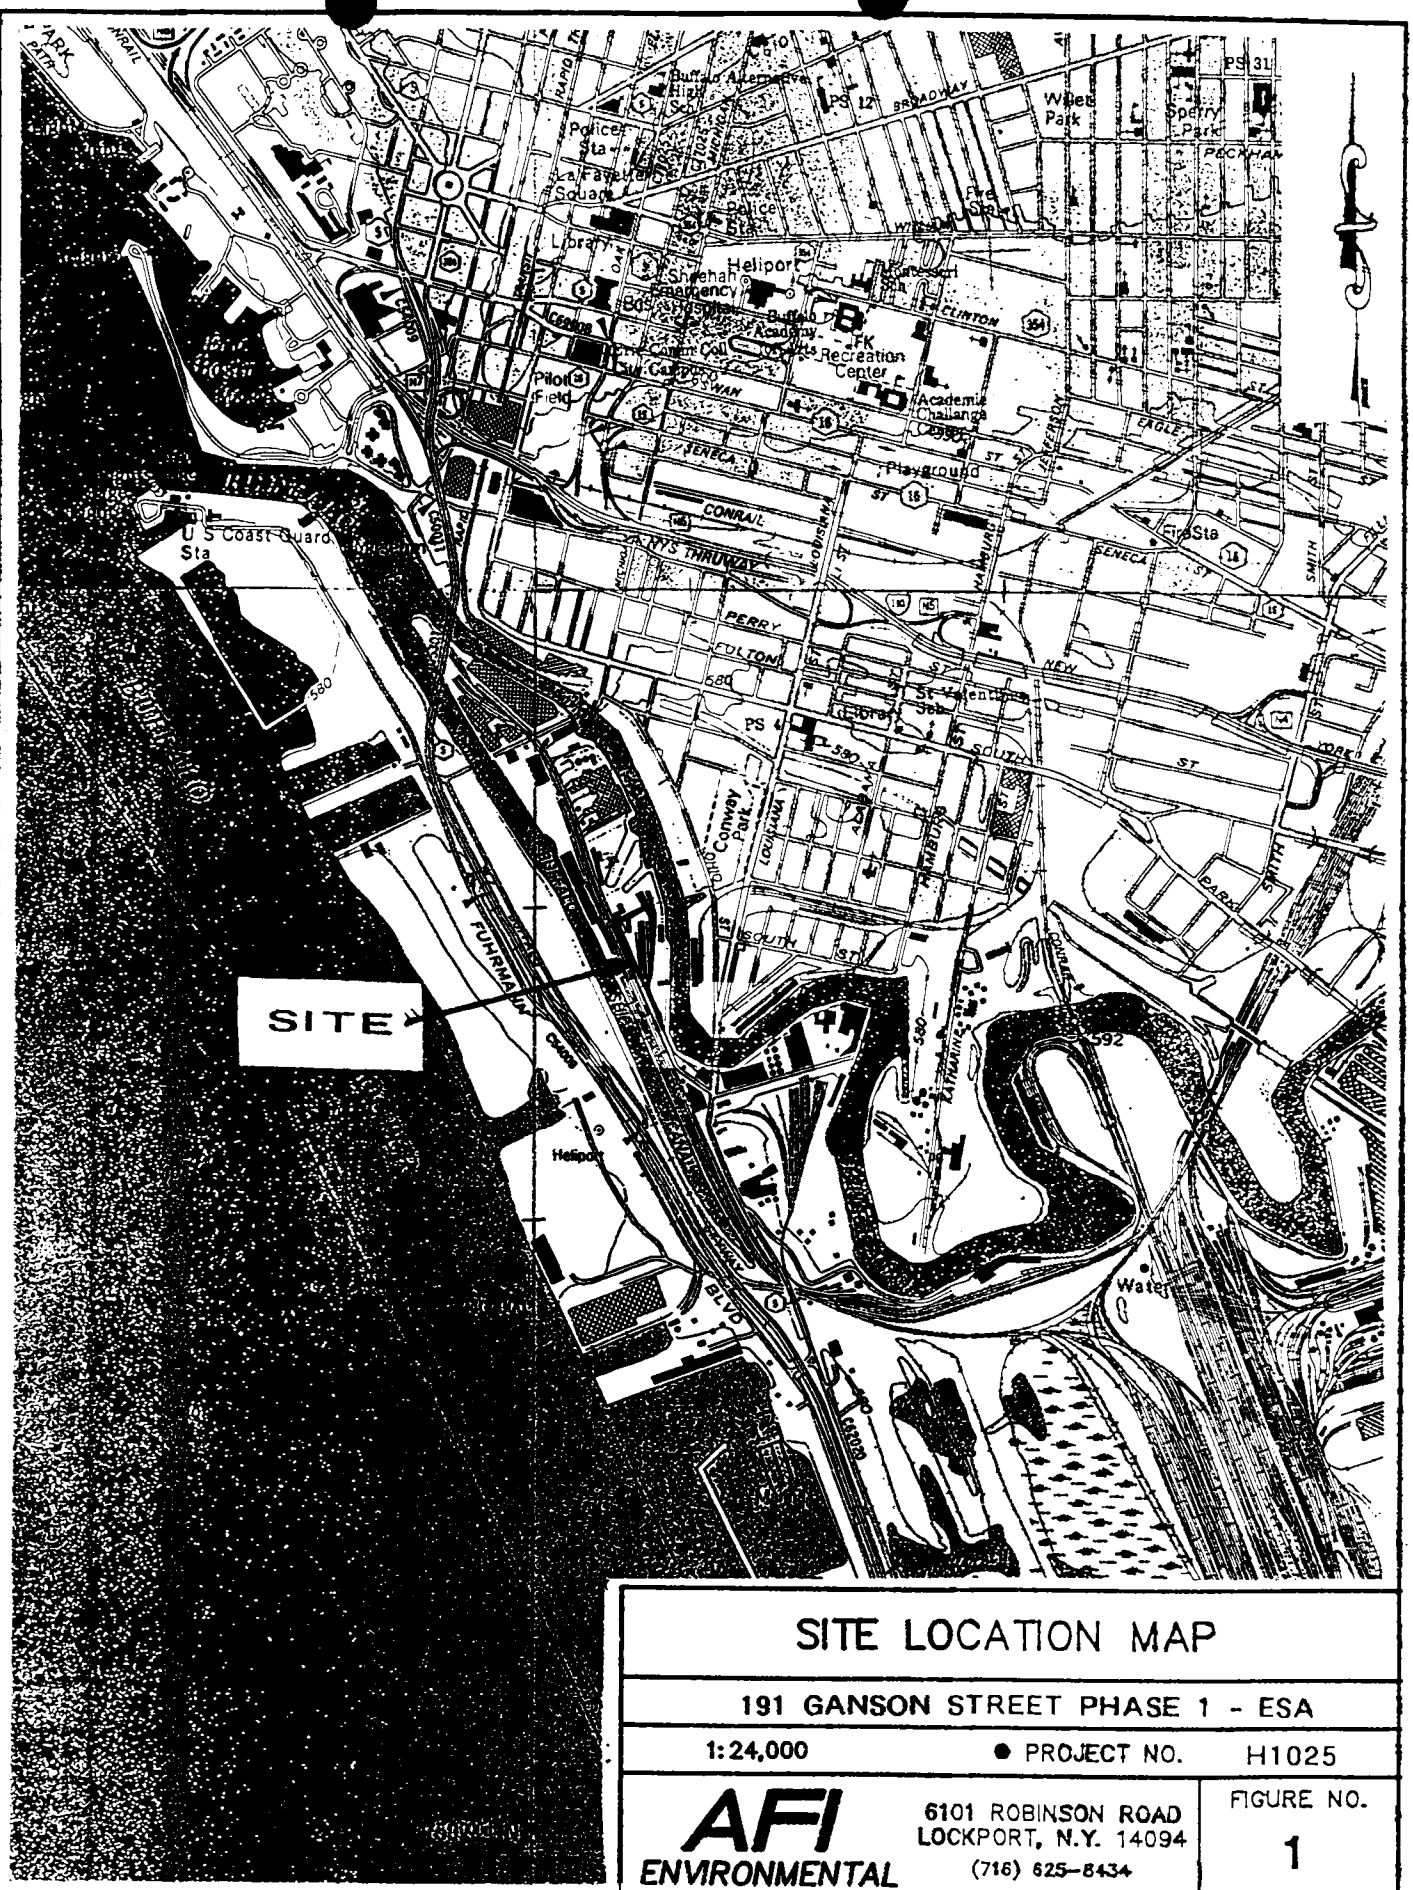
1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this *Soil and Sediment Remediation Report* on behalf of Waste Management of New York as documentation of their cleanup activities at 191 Ganson Street; prior to their move to 70 North Gates and subsequent occupation of the facilities by new tenants and/or owners. This report addresses petroleum impacted soil and sediment contamination encountered at the Downing Container Facility; located at 191 Ganson Street, Buffalo, New York (See figure #1 for site location map). This facility was the storage yard and repair shop for Waste Management of New York's Downing Container Division garbage pickup, rolloff and rental operations. This *Soil and Sediment Remediaton Report* (SSRR) was prepared as the final step of a three part process that included Environmental Assessment, Remedial Soil Investigation/ Delineation, and Cleanup.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York Inc. (WMNY), retained AFI Environmental to document the Soil and Sediment Remediation activities conducted by Environmental Products and Services, Inc. (EPS), Waste Managements's cleanup contractor at their 191 Ganson Street Facility.



This report has been developed for the private use of Waste Management of New York Inc., but all discussed activities were conducted under the observation of NYSDEC Spill Control personnel.

1.3 SCOPE OF WORK

The Soil and Sediment Remediation Activities conducted at 191 Ganson Street were consistent with the site specific recommendations made by AFI Environmental in their report entitled **"REMEDIAL ACTION PLAN SOIL INVESTIGATION REPORT"** dated April 6, 1995. These recommendations included:
(See figure #2 for site map).

- Removal of a 10' by 10' by 18" area of soil where chemical constituents were identified in the area of previously removed Underground Storage Tank (UST).

- Excavation of Study Area # 3, a 25' by 25' by 18" area located in the vicinity of the rolloff staging area where toluene contaminated soils were staged awaiting NYSDEC approval for disposal.

FIGURE NO. 1

- o Excavation of stained areas of the parking lot near the fuel islands and near the overnight truck parking area and other areas where visible.

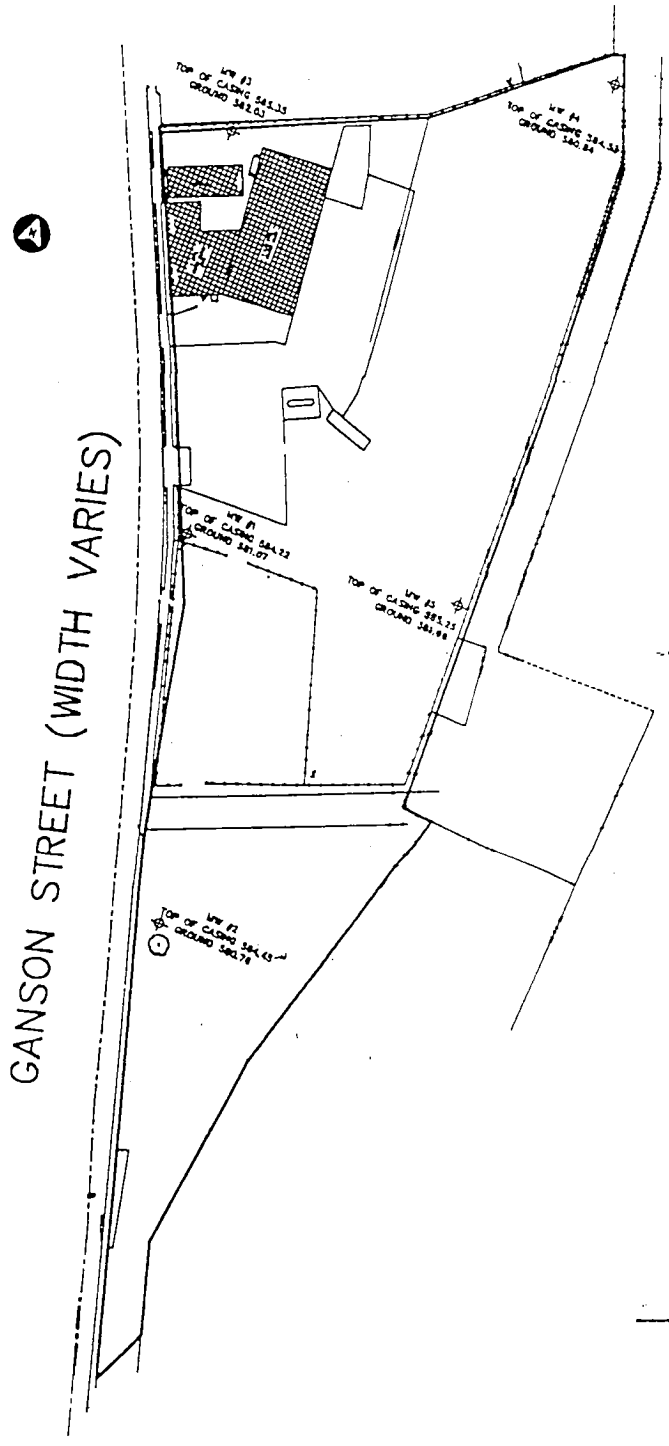
- o Sediment removal and cleaning of the Storm water drains.

- o Backfilling and compacting of all excavated areas with #2 crusher run stone.

- o Sampling excavated areas to demonstrate all contaminates have been removed.

- o Sampling excavated soils for waste characterization and disposal services purposes.

2.0 REMEDIAL PROGRAM



2.1 OVERVIEW

The Remedial program implemented at the facility located at 191 Ganson Street consisted of the excavation, removal and off-site disposal of impacted soils from the following areas (See Figure #3): the vicinity of the previously removed UST, near the North property line; from the roll-off staging area, near the East fence line, from the overnight truck parking area, near the gas fueling island; and contaminated sediment from the storm water sewer. This approach was utilized due to the relatively small volume of chemically impacted soil/sediment occurring at the site. All remedial activities were performed by Environmental Products and Services, Inc., a qualified and experienced remedial contractor, under the supervision of an AFI Environmental Engineer. In addition, New York State DEC Spill Control Personnel observed excavation and disposal activities. The procedures and equipment utilized were selected to minimize any potential for cross contamination, while maximizing the effectiveness of the clean-up effort. The following subsections provide a detailed description of the remedial measures implemented at the WMNY Site.

2.2 SOIL REMEDIATION

2.2.1 SOIL EXCAVATION NEAR THE PREVIOUSLY REMOVED UST (NORTH PROPERTY LINE)

Gravel and soil were excavated from a 10' by 10' by 18" area in the vicinity of the previously removed UST location (See figure #3). The excavation was accomplished using a backhoe and front end payloader operated by EPS personnel. The original excavation was enlarged by an additional 10' by 10' by 18" when petroleum stained material was identified by the AFI field engineer on the Eastern wall of the excavation. Similarly the depth of the excavation was increased to 30" when stained soils were evident on the floor of

the 18" excavated area. The excavation continued horizontally and vertically until no visual evidence of petroleum impacted soils were observed. All scrapings were placed in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.2 SOIL EXCAVATION IN THE VICINITY OF THE ROLL-OFF STAGING AREA (EAST PROPERTY LINE)

Gravel and soil were excavated from a 25' by 25' by 18" area in the vicinity of the roll-off staging area (See figure #3). The excavation was accomplished using a backhoe and front end payloader operated by EPS personnel. The original excavation was increased when petroleum stained material was identified by the AFI field engineer on the floor of the excavation. The depth of the excavation was increased to 36" when stained soils were evident on the floor of the 18" excavated area. Examination of the base of the excavation showed the fill material to be placed around a historic railroad hid with wooden cross ties and a wooden floor or foundation. The detenation of the wooden floor stained the soils black. This foundation layer continued in all directions for a thickness of approximately 4" - 5". To verify the contact of this fill layer one analytical sample was collected. The excavation continued to the depth and width where minimal evidence of impacted soils was observed. All scrapings were placed in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.3 SOIL EXCAVATION IN THE VICINITY OF THE OVERNIGHT TRUCK PARKING AREA AND FUEL ISLANDS.

Gravel soil in this section of the parking lot was excavated to a depth of 6" by a width of 15' and the length of 125' on both the East and West sides of the overnight truck parking area and fuel island. The excavation was completed by EPS Personnel using the front bucket of a payloader and scraping the surface to a depth of 6". A visual check of the excavation was made by AFI Personnel, after the excavation, to verify that all signs of staining had been removed. All scrapings were places in poly-lined roll-off containers. Transport and disposal was in accordance with section 2.4. The reclamation of the excavation was in accordance with 2.5.

2.2.4 SPOT CLEAN UP

Gravel soil in the parking lot displaying visual signs of staining was excavated using a backhoe and placed into a poly-lined roll-off container. Excavation was to a depth and lateral extent large enough to remove all visual signs of staining.

The transport and disposal of stained soil excavated from these

areas was in accordance with section 2.4. The reclamation of the excavation was in accordance with section 2.5.

Following the completion of the measures outlined above, all areas excavated were filled with number 2 crusher run stone, compacted and leveled.

2.2.5 REMOVAL OF DRILLING CUTTINGS FROM PREVIOUSLY INSTALLED WELLS

Three (3) 55 gallon drums containing auger cuttings collected during the installation of the monitoring wells installed on site were disposed of by EPS Personnel. The drums were off-loaded into the Poly-lined roll-off containers, crushed flat, and disposed of with the soils.

2.3 SEDIMENT REMEDIATION

2.3.1 STORM SEWER SEDIMENT

Storm sewer remediation was conducted by the above contractor at later date. This was due to the need, by WMNY to obtain approval, from the Buffalo Sewer Authority, for disposal of the discharge material; prior to discharge into the Buffalo Sewer System. Sediment was removed from four (4) Storm Water inlets by using a vacuum line attached to a 3,000 gallon vacuum truck. Flushing of the sewer line was accomplished using a high pressure, water lancing system. The vacuum truck was operational during the sewer flushing procedure to capture the wash water. After flushing, the sediment accumulated at each inlet basin was manually removed and captured by the vacuum truck. All sediment and wash water was disposed of at the Buffalo Sewer Authority under proper disposal permits. AFI field engineers inspected the clearing activity after the activities had been completed.

2.4 TRANSPORT AND TREATMENT/DISPOSAL OF SOLID AND LIQUID WASTES

Impacted soil and sediment generated during the remedial program were placed in poly lined roll-off containers prior to removal from the site. This material was transported by Waste Management, a permitted hauler, to High Acres Landfill, a non-hazardous waste landfill, which was authorized to receive petroleum impacted soils. Analytical data from the chemical profiling of impacted soils collected prior to the remedial activities was utilized for waste characterization purposes. Analysis of soil collected during excavation is presented in Appendix A. This information was utilized by Waste Management personnel to complete Form 47-19-7, *Application for Treatment or Disposal of an Industrial Waste Stream* contained in Appendix B. All soils were disposed at the High Acres Landfill in Fairport, New York.

Wash water generated during the Storm Water cleaning, and collected by the vacuum truck, was transported under the appropriate permits to Buffalo Sewer Authority for treatment and/disposal. Sediment contained within the vacuum truck were removed and disposed at a permitted facility. Records documenting the transport and proper disposal of all solid and liquid waste were retained by Waste Management personnel and are not part of this report.

2.5 EXCAVATION RECLAMATION

2.5.1 BACKFILLING AND COMPACTION

EPS Personel backfilled each excavated area with clean #2 crusher run stone, then compacted the area by repeated running over the stone with a payloader. Final shaping was conducted by scraping the surface level. Photographs of the facility clean up activity are presented in Appendix C and Analytical Results are present in Appendix A.

2.5.2 BLACKTOPPING

Blacktop areas stained from the chronic overnight leaking of oil and grease from Packer and Roll-off Trucks, were scraped and resurfaced with a 1" top coat of fresh black top. (Photographs see Appendix C).

3.0 ANALYTICAL TESTING

3.1 SAMPLE LOCATIONS

Two (2) types of media were sampled during the course of the investigation performed by AFI Environmental, and can be classified as either soil or gravel. A total of five (5) soil samples were collected. The locations from which these samples were obtained are depicted on Figure 4.

3.2 SAMPLING TECHNIQUES

Two (2) sampling techniques were utilized to collect soil and sediment samples on June 29, 1995, and are described in the following subsections. All samples were collected by an AFI Environmental field engineer and were placed in precleaned laboratory sample bottles, which were labeled with the sample number, date and time of collection, sampler's initials, and the analyses requested.

3.2.1 GRAB SAMPLES

With the exception of the impacted soil samples collected from the location where UST was previously removed, the Roll-off staging area excavation sampling, and the sampling from the excavation near the truck staging area, the remaining soil samples were collected as grab samples. Grab samples were collected using a coated steel trowel that was decontaminated via a detergent wash and deionized water rinse prior to the collection of each sample. Grab soil samples were collected at the base of the excavation conducted in the vicinity of the Roll-off staging area.

3.2.2 HOMOGINIZED COMPOSITE SAMPLES

Homogenized composite samples were assembled to characterize background soil quality and to chemically profile the quality of soils remaining within the excavated areas once the visual evidence of impacted soils had been excavated. Homogenized Composite samples were also collected as a means of profiling soils for waste characterization purposes.

3.3 SAMPLING LOCATIONS

3.3.1 SAMPLING IN THE AREA OF THE PREVIOUSLY REMOVED UST

The sample from the site of the previously removed UST, identified as sample #3 was assembled from samples collected from five (5) points situated at the eastern, western, nothern, southern and bottom margin of the excavated area. Soil from each of these points was collected, placed on a poly sheet, and mixed to obtain a homogenous composite sample. (See figure #4 for sample location and Appendix A for results).

3.3.2 SAMPLING THE EXCAVATION IN THE VICINITY OF THE ROLL-OFF STAGING AREA

The sample from the site of the Roll-off staging area, sample #1 was assembled from samples collected from five (5) points situated at the eastern, western, southern, and north walls as well as the floor of the excavation. Soil from each of these points was collected, placed on poly sheet, and mixed to obtain a homogenous composite sample.

3.3.3 SAMPLING THE SUB-BASE OF THE ROLL-OFF STAGING AREA EXCAVATION

The sample from the Sub-base of the roll-off staging area excavation was collected as a grab sample from the area demonstrating signs of high carbon/wood content (black).

3.3.4 SAMPLING THE EXCAVATION IN THE VICINITY OF THE OVERNIGHT TRUCK PARKING AREA

The sample from the site of the overnight truck parking area, sample #5, was assembled from samples collected from five (5) points situated at the eastern, western, southern, and north walls as well as the floor of the excavation. Soil from each of these points was collected, placed on poly sheet, and mixed to obtain a homogenous composite sample.

3.3.5 WASTE CHARACTERIZATION

The sampling collected for Waste Characterization verification was collected as a composite sample; randomly selected from the spoils pile of excavated material, prior to being loaded into the roll-off container. The composite was made up from 3 distint sub-samples.

3.4 ANALYTICAL TESTING

All soil and sediment samples were transported under proper chain of custody records to Lozier Labs of Rochester immediately following collection on June 29, 1995. All samples underwent testing for waste characterization/PCBS, TCLP Stars 8021, and TCLP Stars 8270. These analytical methods were selected based upon results from earlier investigations at the project site.

The Lozier laboratory report containing the analytical results, QA/QC data, and chain of custody records is presented in Appendix A. These analytical results are discussed in the following paragraphs:

3.5 SOIL SAMPLES

3.5.1 ANALYTICAL RESULTS FROM THE FORMER SITE OF UST

Analytical results for Sample #3 collected as a composite sample from the sides and base of the former UST excavation are presented in Appendix A. As presented these results show that all values for PCB's except PCB-1260 are below quantifiable limits. PCB-1260 was detected at .27 mg/kg. Benzene and Tolumene were detected at 6.9 ug/1 and 1.6 ug/1 respectfully. All Poly Nuclear Aromatic Hydrocarbons identified in EPA method 8270 were below quantifiable limits.

3.5.2 ANALYTICAL RESULTS FROM THE ROLL-OFF STAGING AREA

Analytical results for Sample #1 collected as a composite sample from the sides and base of the roll-off staging area are presented in Appendix A. As presented these results show that all values for

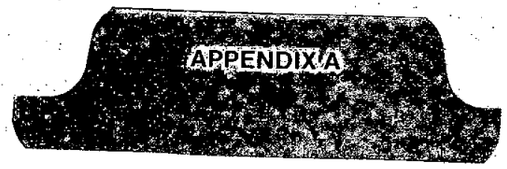
PCB's except PCB-1260 are below quantifiable limits. PCB-1260 was detected at .18 mg/kg. All Poly Nuclear Aromatic Hydrocarbon identified in EPA method 8270 and volatiles identified in EPA Method 8021 were below quantifiable limits.

3.5.3 ANALYTICAL RESULTS FROM BASE OF ROLL-OFF STAGING AREA

Analytical results for Sample #2 collected from the base of the roll-off staging area as a grab sample are presented in Appendix A. As presented these results show that all values for PCB's were below quantifiable limits. Benzene and Toluene were detected at 9.5 ug/1 and 5.0 ug/1 respectfully. All Poly Nuclear Aromatic Hydrocarbon identified in EPA method 8270 were below quantifiable limits.

3.5.4 ANALYTICAL RESULTS FROM TRUCK STAGING AREA

Analytical results for Sample #5 collected as a composite sample from the sides and base of the excavation near the truck staging area are presented in Appendix A. As presented these results show that all values for PCBare below quantifiable limits. All Poly Nuclear Aromatic Hydro Carbon identified in EPA method 8270 and all volatiles identified in 8021 TCLP Extraction were below quantifiable limits.



3.5.5 ANALYTICAL RESULTS FOR WASTE CHARACTERIZATION

As presented in Appendix A, results of Sample #4 analysis indicate that all parameters identified in EPA Method 8270, EPA Method 8021, and EPA Method 608 were below quantifiable limits, except for Toluene at 2.0 ug/L.

4.0 SUMMARY

The evaluation of analytical data resulting from the modified Phase II investigation and supplemental remedial investigation, at 191 Ganson Street, identified some chemical constituents within the soils and sediment from isolated areas across the site and within the storm water drainage system. The data from on site groundwater monitoring wells did not show any signs of chemical contamination of the Groundwater leaving or entering the site.

All areas where chemical constituents were identified in the soils were removed by EPS Personnel and verified as clean by visual inspection by AFI Personnel. The result of composite samples collected after clean-up activities show that all areas excavated were cleaned up to background levels or lower for all chemical constituents. A photographic record of clean-up procedure and site reclamation is presented in Appendix C.

APPENDIX B

GENERATOR'S WASTE PROFILE SHEET

PLEASE PRINT IN INK OR TYPE

Waste Profile Sheet Code: WMNA 326826

This form is to be used to comply with the requirements of a waste agreement.

INSTRUCTIONS FOR COMPLETING THIS FORM ARE ATTACHED

(Shaded Areas For Contractor Use Only)

Decision Expiration Date: 12 / 1 / 95

Contractor Sales Rep#: Hanalca

Service Agr. Renewal Date: / /

A. WASTE GENERATOR INFORMATION

1. Generator Name: Waste Management of N.Y. - Bfle
2. SIC Code:
3. Facility Address (site of waste generation): 421 Ganson St
4. Generator City, State/Province: Buffalo, NY
5. Zip/Postal Code: 14203
6. Generator USEPA/Federal ID #:
7. State/Province ID #:
8. Technical Contact: Tim Eich
9. Phone: (716) 852 - 6121

B. WASTE STREAM INFORMATION (See Instructions)

1. Name of Waste: Contaminated Soil
2. Process Generating Waste: excavation of truck parking area
3. Annual Amount/Units: 50 cubic yards
4. Type A ☒ (2) Type B ☐
5. Special Handling Instructions/Supplemental Information:
6. Incidental Waste Types and Amounts: None Known

C. TRANSPORTATION INFORMATION

1. Method of Shipment: ☐ Bulk Liquid ☐ Bulk Sludge ☒ Bulk Solid ☐ Drum/Box ☐ Other
2. Supplemental Shipping Information:
3. Is a DOT hazardous material? ☒ No ☐ Yes (If yes, complete 4, 5 & 6) 4. Hazard Class/ID #: NA
5. Reportable Quantity/Units (lb/kg): 0 6. Shipping Name: NA

D. TECHNICAL MANAGER DECISION (Check One) ☒ APPROVED ☐ DISAPPROVED ☐ Check if additional information is attached

If Disapproved, Explain:

If Approved, Continue.

1. Management Method(s): CO DISPOSAL OR USE AS DAILY COVER SOIL IN ACCORDANCE WITH PART 360 PERMIT.
2. Precautions, Conditions, or Limitations on Approval: ENSURE COPY OF SERVICE AGREEMENT IS ON FILE
3. For Type A Wastes, Laboratory Analysis of a Representative Sample Was: ☐ Waived ☒ Attached
   If waived, explain why:
4. List Non-WMI Facility that is Approved to Manage this Waste: Date:

Tech. Mgr. Signature: John A. Minchhand Name (Print): John A. Minchhand Date: 06/22/95

E. MANAGEMENT FACILITY INFORMATION / DECISION

1. Proposed Management Facility: High Acres Landfill
2. Proposed Intermediate Transfer Facility: 3. Transporter: Waste Management - Buffalo
4. Management Facility Gen. Mgr. Decision (Check One) ☒ APPROVED ☐ DISAPPROVED

If Disapproved, Explain:

If Approved, List Precautions, Conditions, or Limitations on Approval:

General Mgr. Signature: Joanne Ragusa Name (Print): Joanne Ragusa Date: 6/22/95

Turn Page and Complete Side 2 (If Type B Special Waste, only complete Part J of Side 2)

GENERATOR'S WASTE PROFILE SHEET

PLEASE PRINT IN INK OR TYPE

F. PHYSICAL CHARACTERISTICS OF WASTE (See instructions)

1. Color	2. Does the waste have a strong incidental odor?	3. Physical State @ 70 F/21 C.	4. Layers	5. Specific Gravity	6. Free Liquids:
Brown	☒ No ☐ Yes: If so describe:	☐ Solid ☐ Semi-Solid ☐ Liquid ☐ Powder ☐ Other:	☐ Multi-layered ☐ Bi-layered ☒ Single Phased	Range	☐ Yes ☒ No Volume: %

7. pH: ☐ ≤2 ☐ > 2-4 ☐ 4-7 ☐ [illegible] ☐ 7-10 ☐ 10- <12.5 ☐ ≥12.5 ☐ Range ☐ NA

8. Flash Point: ☐ None ☐ <140°F/60°C ☐ 140 - 199°F/60 - 93°C ☐ ≥200°F/93°C ☐ Closed Cup ☐ Open Cup

G. CHEMICAL COMPOSITION

	RANGE (MIN-MAX)
Soil Matrix	- %
	- %
	- %
	- %
	- %
	- %
	- %
	- %
	- %
Total	%

2. Does the waste contain any of the following? (provide concentration if known)

	NO	or	LESS THAN	or	ACTUAL
PCBs	☐		☒ < 50 ppm		____ ppm
Cyanides	☐		☐ < 30 ppm		____ ppm
Sulfides	☐		☐ < 500 ppm		____ ppm

Please note: Unless analytical results are attached, the chemical composition identification should include, at a minimum, Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Silver, Pesticides, Herbicides, and any other TCLP constituents that may be present in the waste. The total composition must be greater than or equal to 100%. (.0001% = 1 ppm or 1 mg/l)

3. Indicate method used to determine composition (if provided): ☒ TCLP ☐ Total ☐ Other: ____

H. SAMPLING SOURCE (e.g., Drum, Lagoon, Pit, Pond, Tank, Vat) ____

REPRESENTATIVE SAMPLE CERTIFICATION

1. Print Sampler's Name: [illegible] 2. Sample Date: ____

3. Sampler's Title: ____

4. Sampler's Employer if other than Generator: ____

The sampler's signature certifies that any sample submitted is representative of the waste described above pursuant to 40 CFR 261.20(c) or equivalent rules.

5. Sampler's Signature: ____

J. GENERATOR CERTIFICATION

By signing this profile sheet, the Generator certifies:

1. This waste is not a "Hazardous Waste" as defined by USEPA or Canadian Federal regulation and/or the state/province.
2. This waste does not contain regulated radioactive materials or regulated concentrations of PCB's (Polychlorinated Biphenyls).
3. The unshaded portions of this sheet and the attachments contain true and accurate descriptions of the waste material. All relevant information regarding known or suspected hazards in the possession of the Generator has been disclosed.
4. The Generator has read and understands the Contractor's Definition of Special Waste included in Part B.5. of the attached instructions form. All types and amounts of special wastes provided in incidental amounts have been identified in section B.6. of this form.
5. The analytical data presented herein or attached hereto were derived from testing a representative sample taken in accordance with 40 CFR 261.20(c) or equivalent rules.
6. If any changes occur in the character of the waste, the Generator shall notify the Contractor prior to providing the waste to the Contractor.

7. Signature X: [signature] 8. Title: [illegible]

9. Name (Type or Print) X: [illegible] 10. Date X: [illegible]

Dear John,

In accordance with the last paragraph in section IV item 44 of the High Acres Western Expansion Landfill operating permit, please find the attached disposal approval for:

Generator: WM - Buffalo

Waste Stream: cont. soil

Hauler: WM - Buffalo

One Time Disposal:____ Initial Profile: ✓ Recertification:____

Please feel free to contact me should you have any questions.

Sincerely,

Joanne Raguso

Re: Remedial Investigations WMNY - Ganson Street Property

SYNOPSIS ?

Dear Mr. Crossen:

Enclosed with this letter are copies of the Phase II and Phase III (Remedial Soil Investigation) reports that have been generated as part of an environmental assessment being perform at the Waste Management of New York, Inc. hauling division property on Ganson Street in Buffalo, N.Y.. Also included with the two reports is a copy of the work plan for the Phase III investigation. As I mentioned during our recent telephone conversation, the environmental assessment was performed as part of a purchase and sale agreement, where WMNY was selling the Ganson Street property to another party.

As the result of the various phases of the environmental assessment, it has been noted that there are localized areas of impacted soil as the result of fueling spills and leakage from parked vehicles. The impacted areas are nothave ed in the attached Phase III report. When you review the Phase II report you will note that five shallow overburden monitoring wells been installed and that groundwater samples have been obtained and analyzed with no impacts observed. In addition several soil and sediment samples were obtained and the results of these samples prompted the Phase III investigation.

The Phase III investigation contains recommendations for soil removal and additional testing to document that the impacted soils have been removed. We would like to be able to initiate the soil removal and additional testing as soon as possible, since the hauling division will be required to vacate the property to the new owner by mid June 1995.

Your timely review of these reports is very much appreciated. Please feel free to contact me, should you have any questions or comments regarding this matter. Thank-you.

Sincerely,

John A. Minichiello

RE: Remedial Soil Investigation Report
Downing Container Services - 191 Ganson St., Buffalo NY
AFI Project # h1025.1

Dear Mr. Minichiello:

Please find enclosed three copies of the Ganson Street Remedial Action Soil Investigation Report for the Downing Container Services 191 Ganson Street, Buffalo, New York location. One Copy is within scope of the original budget, and two copies provided for the New York State DEC are out-of-scope of the original budget.

If you need a change order for the two extra reports please let us know. Should you have any questions, please don't hesitate to call me at (716) 283-7645.

Sincerely,

AFI ENVIRONMENTAL

William L. Heitzenrater

APPENDIX B

1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this **Remedial Soil Investigation Report (RSIP)** on behalf of Waste Management of New York, Inc. This RSIP is intended to address petroleum impacted soil and sediment encountered at the Downing Container Facility located at 191 Ganson Street, Buffalo, New York (Figure 1). This facility is the storage yard and repair shop for Waste Management of New York's Downing Container Division's garbage pickup, roll-off and rental operation. This RSIP was prepared to address potential areas of environmental concern (AECs) identified in a Phase I Investigation conducted on October 1994 and a modified Phase II Investigation completed on December 1994. The ESA and subsequent Phase II Investigation resulted in the detection of low level organic, inorganic, and PCB constituents in soil and sediment samples collected at the Ganson Street site. The areas of the site in which constituents were indicated include the following (refer to Figure 3).

The chemical analysis of sediment samples collected from within the storm sewer staging areas and gas islands indicated the presence of semi-volatile organic compounds (SVOC), PCBs metals at concentrations which exceed NYSDEC guidance levels. Potential sources which may have individually or collectively resulted in the impact to sediment and soil samples include petroleum based fluids utilized for facility operations; runoff of liquids from the garbage trucks or roll off boxes and fluid leakage from parked trucks and automobiles. Potential pathways of releases from these sources to the storm water control system include; runoff received by the storm sewer from the exterior roll off and truck staging area or fueling islands; and runoff from the parking area captured by the storm sewer.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York, Inc. retained AFI Environmental to further investigate the areal extent and composition of impact constituents in an attempt, to identify the cost to mitigate existing soil/sediment contamination at their 191 Ganson Street Waste management facility.

This RSIP has been developed for the private use of Waste Management, but in accordance with NYSDEC guidance memorandum.

This report presents the results of previous investigations conducted at the project site; outlines the scope of the Remedial Investigative program, identified the equipment and procedures utilized, and discusses results of the current investigation. This information is presented to identify the extent of soil and sediment contamination and support AFI's recommendation for

remediation/disposal options.

1.3 SCOPE OF WORK

The Remedial Soil Investigation conducted at the Ganson Street facility was consistent with the site specific sampling plan approved by Waste Management. The purpose of the investigation was to characterize the aerial extent of chemical constituents identified in the soils, through establishment of a grid sampling system in each of the three (3) areas identified as: areas of potential concern (AECs); during the previously completed Environmental Phase I and Modified Phase II Investigations. The scope of work consisted of the following remedial objectives:

- o Identification Of Three (3) General Investigative Areas.
- o Establishment Of A Sampling Grid At Each Area.
- o Selection And Implementation Of Soil Sample Collection Techniques.
- o Sample Composite Homogenization Techniques.
- o Development Of A Site Specific And Health And Safety Plan.
- o Data Presentation And Fecommendation For Delineation Of The Area Of Eexcavation And Disposal.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing Container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding

properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities included natural gas from National Fuel and Electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York,* the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structure. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

The Federal Emergency Management Association (FEMA) Flood Insurance rate Map (Panel No. 360230 0020) was consulted to determine the flooding potential of this site. It was determined that the site is not located within the one-hundred year of five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (<10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River.

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and Materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
- Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).
- One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:
  - spent non-halogenated solvents (F003,F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
- The site itself is a listed petroleum bulk storage facility. Additionally, two (2) petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:
- There are three (3) LST (Leaking Storage Tanks) sites located with 0.5 radius of the subject property.

3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York Inc.), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface and groundwater of the subject property. The purpose of the investigation was to determine the presence or absence of environmental impacts on the site.

3.3 MODIFIED PHASE II INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil

sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental. The final report was issued in December 1994.

3.3.1 MODIFIED PHASE II SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

3.3.2 MODIFIED PHASE II SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening. Excess material collected from the catch basins was returned to the bottom of the catch basins.

3.3.3 MODIFIED PHASE II SAMPLE COLLECTION/SCREENING AND ANALYSIS TECHNIQUES

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analysis. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were placed in appropriately labeled sample containers for transport under proper chain of custody record to Lozier Laboratories for chemical analysis.

3.3.4 MODIFIED PHASE II SOIL INVESTIGATION

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNU PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

Two (2) samples of the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-3846 Method 8240 for VOCs, TCL SEMI-VOCs by method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s, and Cyanide by Method 9012.

3.3.5 MODIFIED PHASE II SOIL RESULTS

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum constituents, possible from fuel oil. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location #9 (see figure #3).

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10 and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data.

3.3.6 MODIFIED PHASE II GROUNDWATER RESULTS

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. Based on a comparison with applicable guidance valued established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the constituents encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that constituents originating from areas off-site are not migrating on-site via the groundwater flow system and that the onsite constituents are not migrating offsite via the groundwater system.

3.4 MODIFIED PHASE II CONCLUSIONS/RECOMMENDATIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if

petroleum impacted soil was present and to characterize groundwater quality. In general, impacted soil was encountered in varying degrees in the areas sampled. Due to the analytical testing method utilized to SCAN soils no determination was made as to whether contamination encountered exceeded NYSDEC guidance values. It was suggested that some of the particular constituents levels could exceed the NYSDEC STARS limits, but this is unknown because TCLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCS, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location #14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260. A recommendation for TCLP analysis of the suspect area was made.

4.0 REMEDIAL INVESTIGATION

The Remedial Investigation conducted by AFI Environmental involved the collection and analysis of a series of (5) soil subsamples from three (3) distinct areas of concern; the area near the previously excavated UST (Area #1), the northeast roll off staging area (Area #2), and the area near the gas islands and storm sewer inlet (Area #3). These areas were identified during Modified Phase II Investigation as areas of environmental concern (AEC) and they are identified in figure #4. Each area of concern was divided into two (2) study areas and each study area was subjected to five (5) randomly selected subsamples. The subsampling and analysis program was developed to:

- Evaluate chemical constituent concentrations with respect to regulatory levels using TCLP Extraction Protocol; and
- Chemically profile potentially impacted soils and determine rough quantities requiring disposal at appropriately permitted facilities.

4.1 SAMPLING TECHNIQUES

Five (5) randomly selected soil subsamples were collected by an AFI Environmental field representative from each study area. Subsamples were collected at each location by scooping soil from the tailings of a hand auger at a depth of 6" to 18" using a precleaned stainless steel sampling spoon. The soil from each of the five (5) subsamples was placed in a precleaned stainless steel five (5) gallon bucket, and homogenized. A representative subsample was collected from the homogenized soil, in each study area, and placed in precleaned, sample bottle, labeled with the sample number, date and time of collection, sampler's initials, and the analysis requested and transported to Lozier Labs of Rochester under proper chain of custody.

4.1.1 Homogenized Composite Samples

Homogenized composite samples were assembled to characterize background soil quality and to chemically profile soils contained within the area showing previous evidence of contamination. Five (5) discrete subsamples were homogenized into one (1) sample for each study area.

4.1.2 STATISTICAL SAMPLING GRID

Each area of concern was divided into two (2) components or study areas. One component representing the "near-field" area, and a second component representing the "far-field" area. The "near-field" component consisted of a 25' x 25' area of soil "near" the Modified Phase II Investigation sample locations. The second component or "far-field" area consisted of a larger 125' x 125' square area concentric to the "near-field" study area. Both study areas were divided using a standard grid pattern into 36 intersections. The 36 intersection of the "near-field" were created by 5' spacing while the 36 intersections of the "far-field" area were created by 25'spacing. Five (5) locations were randomly selected for soil subsampling inside each study area and one (1) homogenized composite sample was assembled and sent for analysis from each area. This resulted in a total of five (5) samples being sent to Lozier Labs for analysis. (No "near-field" subsample was collected from the storm sewer and gas island area due to the concrete pad and pavement encountered).

4.2 ANALYTICAL TESTING

All soil samples were immediately transported under proper chain of custody records to Lozier Laboratories, Rochester, New York. All samples underwent testing for the Toxicity Characteristic Leaching Procedure (TCLP) STARS Volatiles 1311(8021), and semi-volatile organic compounds (SOCs) in accordance with EPA SW-846 Method 1-311/8220. These analytical methods were selected based upon discussion with Waste Management of New York personnel and due to the types of contaminants identified during earlier investigations at the project site.

5.0 RESULTS

Appendix A includes the results for all analysis conducted on the homogenized composite samples for the three (3) Study Areas. Only one (1) sample (PT #3) from the "near-field" study area #2 (see figure #4) exceeded the New york state Dec Guidance values as presented by the NYSDEC S.T.A.R.S. Program Analtical Test. This exceedance was noted for the chemical Parameter of Napthalene at location #2 where the presented value equalled 18ppb (adjusting for the 5 to 1 dilution equates to 90ppb). All other tested parometer were listed as non-detects or below the detection levels as presented by Lozier Labs.

6.0 CONCLUSIONS

According to SPOTS No. 14 (May 15, 1991) "...if the field analysis does not indicate any contamination at the site, and laboratory analysis of a minimum amount of sampling of soil/water taken from around the tank and piping confirms no contamination at the sample locations, it is reasonable to assume that no contamination exists at the site.

(However) If this minimum sampling does show contamination, then the Department (DEC) must be notified of this contamination and additional laboratory analysis must be conducted."

Since, AFI has already conducted additional analysis and the results from all but one area showed no contamination (utilizing a five (5) to one (1) dilution); it is reasonable to assume that chemical constituents in the soils are limited to the original sampling areas, and the one study area where chemical constituents exceeded guidance values.

AFI RECOMMENDATION

Generally a Phase III Site Assessment; or Exposure Assessment is conducted, at this point, to predict possible migration pathways or routes; and to identify areas where chemical constituents released into the soil may impact public health or the environment.

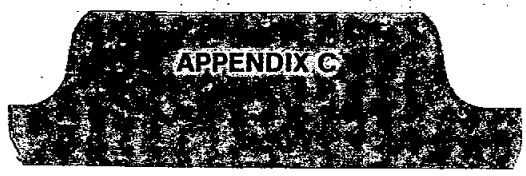
Phase III procedures generally include mapping the distribution of contamination, and predicting the pathways for exposure. The factors considered during a Phase III study include the volume released (which we do not know, but we assume to be minimal); the absorption capacity of the soil (which is medium to high); the relative ability of the soils to allow water movement (which is low); rate and direction of groundwater movement (known to be slight); and all processes that dilute concentration and limit the area of the contaminated zones (see Phase I and Modified Phase II reports).

However, the lack of detectable levels of the chemical constituents in the onsite monitoring wells; taken in consideration with the lack of detection of chemical constituents in all but one of the suspect areas during the most recent extended sampling; would allow one to conclude that TCLP contamination was limited to the one area demonstrating exceedance of the guidance values and the limited areas near each of the original modified Phase II sampling locations.

As such, AFI recommends that all areas where original contamination was documented during the modified Phase II Investigation be excavated and removed in a 10' x 10' area to a depth of 18". The excavation should be closed with #2 crusher run and/or fill and compacted for immediate use.

Study Area #3 should be excavated to 18", or refusal, throughout entire 25' x 25' boundary and replaced with clean and packed #2 crusher run stone. In addition, any stained areas near the truck parking, or roll off staging area, and fueling islands should be removed and filled with clean #2 crusher run stone and packed. All concrete should be steamed washed and the storm sewer inlets should be thoroughly cleaned with a VAC-Truck and steam washed after sediment removal.

All excavated soils should be staged in plastic lined roll off containers and a representative soil sample collected for waste profiling procedures.



AFI further recommends that additional composite samples be taken from the side walls and bottom of each excavated areas as well as from 1' to 2' beneath the excavation and run for TCLP. This data should be evaluated to assure that all chemical constituents have been removed.

A total of four (4) additional samples would be collected one (1) from each study area and one (1) from the staged soils to document the clean up.

AFI recommends removal of all visually stained soils in each of the study areas to a depth of 18".

All removed and/or contaminated soils should be properly disposed of at a legally permitted facility.

AFI also recommends that a copy of the final closure report be submitted to the DEC as a token of good faith and request there comments once the final samples have been tested and the site is documented to be clean so that they have record of the cleanup.

East Rochester, New York 14445

RE: Remedial Soil Investigation **FINAL/REVISED DRAFT PLAN**
Downing Container Services- 191 Ganson St., Buffalo, NY
AFI Project No. H1025.1

Dear Mr. Minichiello:

Enclosed, please find the revised draft copy of the Ganson Street Remedial Action Plan. This is in response to your review and mark ups. We are ready to begin as soon as the snow is off the study area or sooner if you desire to have the snow scraped.

Please advise.

Should you have any questions or comments please don't hesitate to call me at the Lockport office.

Sincerely,

AFI ENVIRONMENTAL,

William L. Heizenrater

1.0 INTRODUCTION

1.1 BACKGROUND

AFI Environmental has prepared this *Remedial Action Plan* (RAP) on behalf of Waste Management of New York, Inc. This RAP is intended to address petroleum impacted soil and sediment encountered at the Downing Container Facility located at 191 Ganson Street, Buffalo, New York (Figure 1). This facility is the storage yard and repair shop for Waste Management of New York's Downing Container Division's garbage pickup , roll-off and rental operation. This RAP was prepared to address potential areas of environmental concern (AECs) identified in a Phase I Investigation conducted on October 1994 and a modified Phase II Investigation completed on December 1994. The ESA and subsequent Phase II Investigation resulted in the detection of low level organic, inorganic, and PCB constituents in soil and sediment samples collected at the Ganson Street site. The areas of the site in which constituents were indicated include the following (refer to Figure 2).

The chemical analysis of sediment samples collected from within the storm sewer staging areas and gas islands indicated the presence of semi-volatile organic compounds (SVOC), PCBs metals at concentrations which may exceed NYSDEC guidance levels. Potential sources which may have individually or collectively resulted in the impact to sediment and soil samples include petroleum based fluids utilized for facility operations; runoff of liquids from the garbage trucks or roll off boxes and fluid leakage from parked trucks and automobiles. Potential pathways of releases from these sources to the storm water control system include; runoff received by the storm sewer from the exterior rolloff and truck staging area or fueling islands; and runoff from the parking area captured by the storm sewer.

1.2 PURPOSE AND OBJECTIVES

Waste Management of New York, Inc. has retained AFI Environmental to investigate further the areal extent and composition of impacts in an attempt to identify the cost to mitigate existing soil/sediment contamination at their 191 Ganson Street Waste Management facility. This RAP has been developed for the private use of Waste Management, but in accordance with NYSDEC guidance memorandum. This plan presents the results of previous investigations at the project site; and outlines the scope of the proposed remedial investigative program, and the equipment and procedures to be utilized to evaluate the areal extent of soil and sedimentary contamination to determine the cost of remediation/disposal.

1.3 SCOPE OF WORK

The remedial program proposed for implementation at the Ganson Street facility consists development of a site specific sampling plan in an attempt to characterize the aerial extent of chemical constituents identified in the soils, through establishment of a grid sampling system in

each of the three (3) areas identified as: areas of potential concern (AECs); during the recently completed Environmental Phase I and Modified Phase 2 Investigations. The scope of work required to accomplish these remedial objectives includes the following:

- o Identify three (3) general Investigative areas.
- o Establish a Sampling Grid at each area.
- o Identify Soil Sample Collection techniques.
- o Identify Sample Composite Homogenization techniques.
- o Provide a site specific and Health and Safety Plan.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson Street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities included natural gas from National Fuel and electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York*, the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings,or other impervious structure. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

The Federal Emergency Management Association (FEMA) Flood Insurance rate Map (Panel No. 360230 0020) was consulted to determine the flooding potential of this site. It was determined that the site is not located within the one-hundred year or five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (< 10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River.

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- o There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- o The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).

- One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - spent non-halogenated solvents (F003,F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- The site itself is a listed petroleum bulk storage facility. Additionally, two petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:

- There are three LST (Leaking Storage Tanks) sites located within 0.5 radius of the subject property.

3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York Inc.), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface and groundwater of the subject property. The purpose of the investigation was to determine the presence or absence of environmental impacts on the site.

3.3 MODIFIED PHASE II INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental. The final report was issued in December 1994.

3.3.1 SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

3.3.2 SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening. Excess material collected from the catch basins was returned to the bottom of the catch basins.

3.3.3 SAMPLE COLLECTION/SCREENING AND ANALYSIS

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analysis. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were place in appropriately labeled sample containers for transport under proper chain of custody record to Lozier Laboratories for chemical analysis.

3.3.4 SOIL

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNu PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0ppm to 0.7 ppm for the ten (10) soil and three (3) sediment samples.

Two (2) samples of the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-846 Method 8240 for VOCs, TCL Semi-VOCs by method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s, and Cyanide by Method 9012.

3.3.5 SOIL RESULTS

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum constituents, possibly from fuel oil. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location #9.

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10) and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data.

3.3.6 GROUNDWATER

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. Based on a comparison with applicable guidance valued established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the constituents encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that constituents originating from areas off-site are not migrating on-site via the groundwater flow system and that the onsite constituents are not migrating offsite via the groundwater system.

3.4 PHASE II CONCLUSIONS/RECOMMENDATIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if petroleum impacted soil was present and to characterize groundwater quality. In general, impacted soil was encountered in varying degrees in the areas sampled. In this case we don't know that the values exceed the NYSDEC requirements because of the analytical method selected for analysis. It is possible that some of the particular constituents levels could exceed the NYSDEC STARS limits, but this is unknown because TCLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCs, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location #14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260,

4.0 REMEDIAL INVESTIGATION

The investigation proposal by AFI Environmental involves the collection and analysis of a series of soil and sediment samples from three distinct areas; the storm sewer, the UST area, and northeast rolloff staging area. This sampling and analysis program was developed to:

- o To evaluate constituent concentrations with respect to regulatory levels using TCLP Extraction Protocol; and

- o Chemically profile potentially impacted soils and determine rough quantities for disposal at an appropriately permitted facility.

4.1 SAMPLING TECHNIQUES

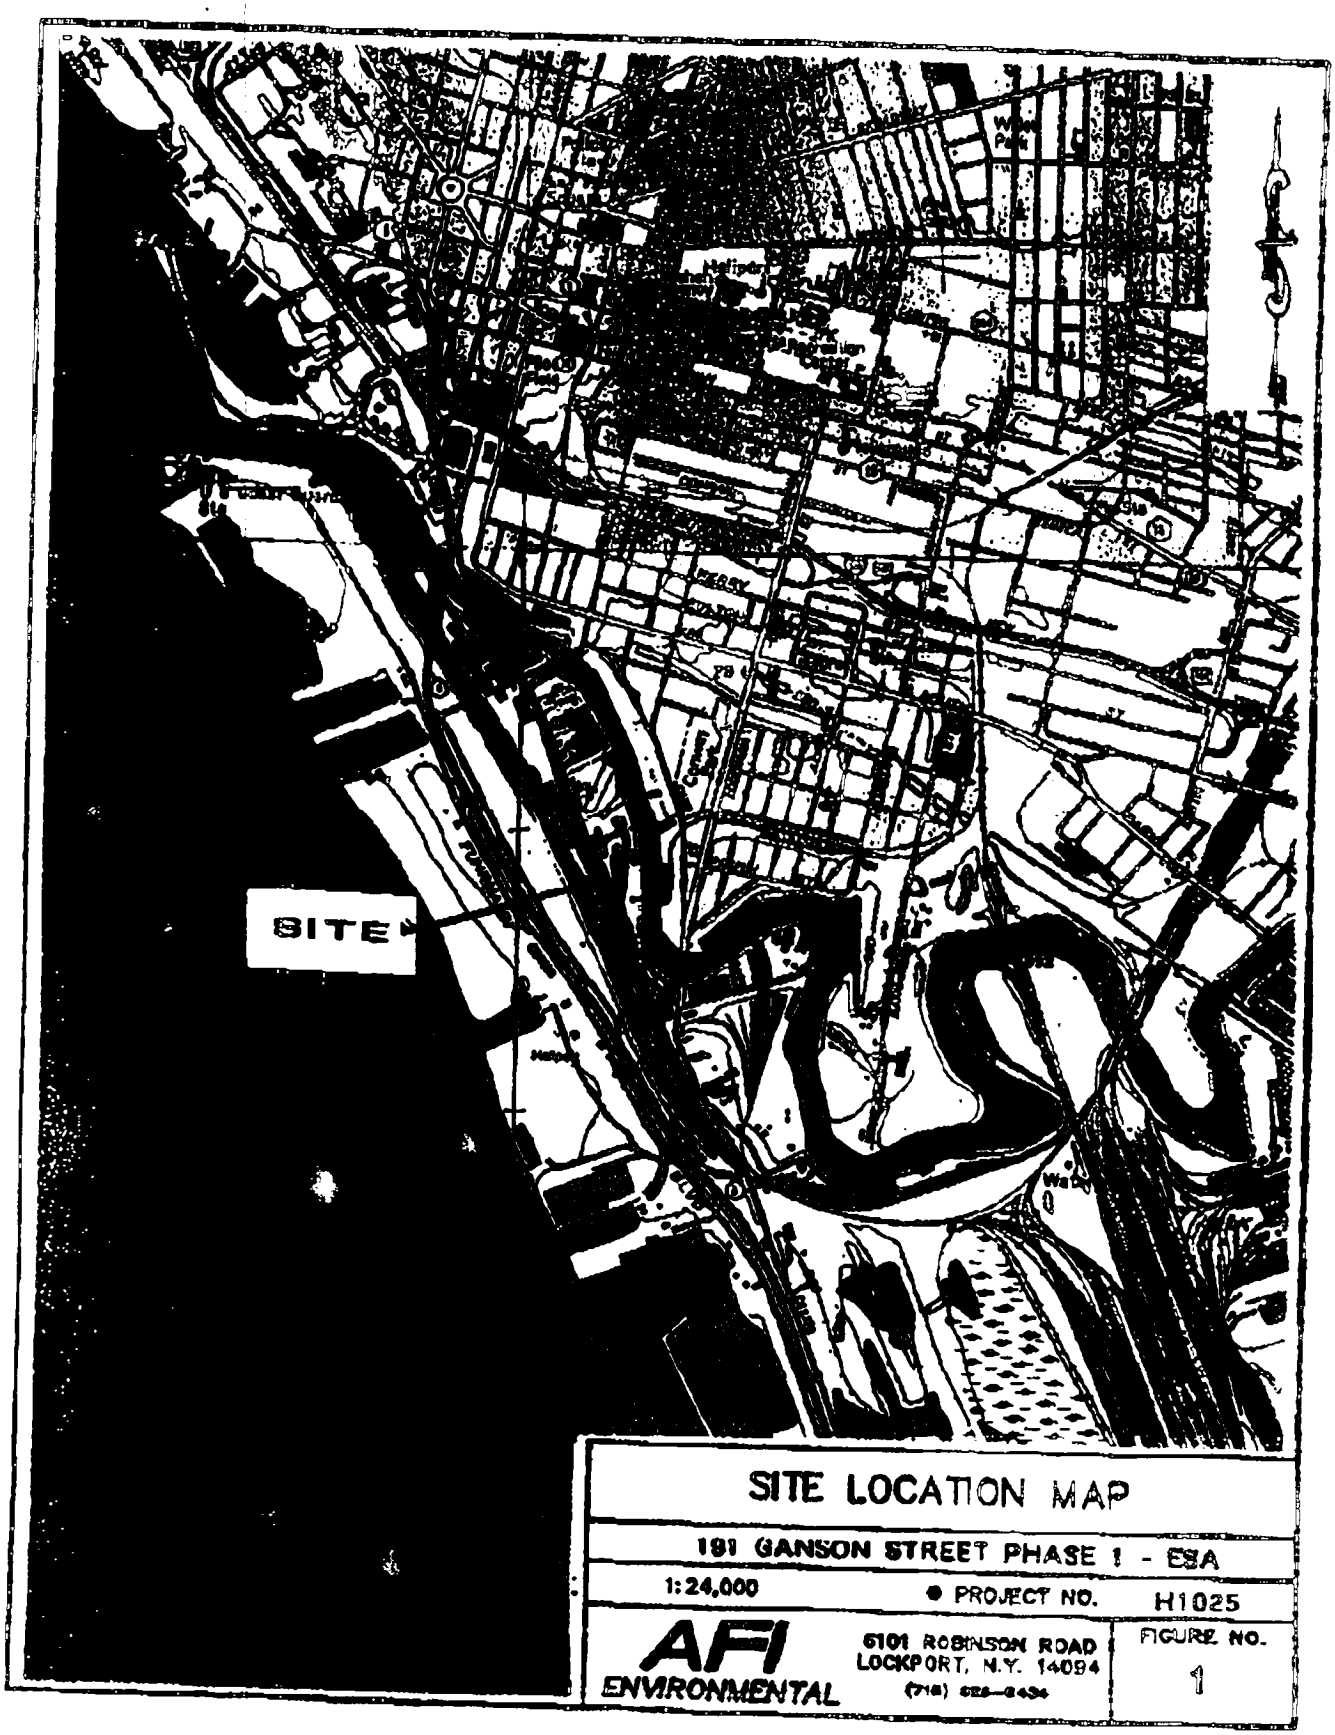
The proposed sampling techniques for soil sample collecting is described in the following subsections. All samples will be collected by an AFI Environmental field scientist and placed

in precleaned laboratory sample bottles, which will be labeled with the sample number, date and time of collection, sampler's initials, and the analysis requested.

4.1.1 Homogenized Composite Samples

Homogenized composite samples will be assembled to characterize background soil quality and to chemically profile soils contained within the area showing previous evidence of contamination.

4.1.2 STATISTICAL SAMPLING GRID



Each are to be investigated will be sectioned off into a statistical sampling grid consisting of two (2) components. The grids will be broken into near field and far field sections. The near field section will consist of the section within a square box whose length is 25 feet centered in the area of the original sampling location. The far field section will consist of a larger square box concentric to the first box, whose length is 125 feet. The near field section will be divided in a grid pattern where the intersections of the x and y axis are on 5 foot intervals, thereby creating 36 intersections. The far field zone will be divided into a grid pattern where the intersections of the x and y axis are on 25 foot intervals thereby creating a grid pattern with again 36 intersections. Five (5) subsamples will be randomly collected from each section and homogenized into a composite sample from each section with a total of two (2) samples from each area to be analyzed for TCLP Stars Volatiles and TCLP Stars Base Neutrals. These will result in a total of six (6) samples plus, field duplicate to be sent to Lozier Labs for analysis.

4.2 ANALYTICAL TESTING

All soil and sediment samples will be transported under proper chain of custody records to Lozier Laboratories, Rochester, New York, immediately following collection. All samples will undergo testing for the Toxicity Characteristic Leaching Procedure (TCLP) STARS Volatiles 1311(8021), and semi-volatile organic compounds (SOCs) in accordance with EPA SW-846 Method 1-311/8220. These analytical methods were selected based upon discussion with Waste Management of New York personnel and due to the types of contaminants identified as a result of earlier investigations of the project site. In addition to internal laboratory quality assurance/quality control (QA/QC) procedures, one (1) field duplicate will be analyzed.

5.0 CONCLUSIONS

Comparisons of the analytical data with applicable regulatory standards and/or guidance values will indicate the toxicity characteristics with respect to constituents analyzed. The data will be adjusted to correct for the dilution factor and compared to the applicable regulatory standards to determine if disposal is warranted and to estimate the rough quantities of disposal.

RE: GANSON STREET (REVISED) PHASE 11 ENVIRONMENTAL INVESTIGATION.
AFI Project #h1025

Dear John:

Enclosed, please find the **REVISED** copy of the Environmental Phase 11 Investigation for Ganson Street, Buffalo, NY. I have incorporated your comments of 12/23/94 into the text where appropriate. In respect to the final comment of your fax, dated December 23, 1994 "... where did you obtain the values for allowable soil concentrations in Table 2?" The values presented are from the NYSDEC TAGM dated January 24, 1994 #HWG94-4046. (copy enclosed). The table has been edited to include this reference. This document also discusses the 100 factor.

Also, please find a copy of our invoice for the above referenced project.

Please review, and call me if you have any further questions or comments.

I will be in my Lockport office until Friday the 30 of December, However, I will e on vacation the week of January 1-8 1995.

Have a great and prosperous NEW YEAR.

Sincerely,

AFI ENVIRONMENTAL

William L. Heitzenrater

1.0 INTRODUCTION

AFI Environmental was retained by Waste Management to conduct a Phase II Investigation of the property located at 191 Ganson Street in Buffalo, New York. This property was the subject of a Phase I Environmental Site Assessment (ESA), performed by AFI Environmental (AFI), which identified several potential areas of environmental concerns (AEC's). Further investigation was conducted to assess the potential environmental impacts that may have occurred or were related to the AEC's. Specifically, AFI identified several AEC's which include, but may not be limited to, the following:

- Numerous petroleum stained areas both in the garage areas and the staging/parking areas;
- Soils in and around the area of the former gasoline underground storage tank (UST) were never sampled and analyzed to confirm that no leakage had occurred from the UST.
- The fill materials utilized to backfill the dry docks north of the site, have been shown to contain elevated levels of VOCs, PCBs and metals. Additionally, groundwater in this area has also been shown to contain elevated levels of acetone, methylene chloride and metals.
- Potential impacts on the site from contaminants in the Buffalo River.
- Potential impacts on the site due to contaminants released on the adjacent properties.
- Potential discharges, including petroleum products and other vehicle operational and maintenance products, into the combined sanitary/storm sewers on site.
- Historical uses of the property for industrial purposes.
- Potential impact to the soils and stormwater sewers in and around the staging areas from leakage of leachate from trucks and roll-offs during routine operations.

The Phase II investigation of the project site was conducted to assess whether the identified AEC's have resulted in environmental impacts on the site and to characterize groundwater beneath the site. The field aspects of this investigation involved the drilling of test borings, the installation of monitoring wells and the collection of soil and groundwater samples. Soil and groundwater samples obtained during this field program were submitted for chemical analyses to enable an evaluation of site conditions relative to regulatory policy. AFI has prepared this *Phase II Investigation Report* to summarize the field investigation; present the results of the chemical analysis of soil and groundwater samples; evaluate the analytical data

Printed on recycled paper to help protect the environment

with respect to applicable regulatory standards and/or guidance values; and to identify potential sources of contamination. No attempt was made to determine the actual boundaries of contamination, if found.

2.0 SITE DESCRIPTION

Figure 1 graphically depicts the property location on Ganson Street south of the intersection with Michigan Avenue in the City of Buffalo, Erie County, New York, which is included on the Buffalo SE NY - 7.5 minute quadrangle of the United States Geological Survey (USGS). The site is approximately 4.78 acre in size and contains one office building, one repair/maintenance garage, one detached office trailer, and gravel driveways and parking areas. The site is generally flat with a very slight slope to the east towards the Buffalo River. As shown on Figure 1, the elevation of the property is approximately 580 feet above mean sea level. Site drainage is accomplished by means of uncontrolled overland flow from the stone driveway and parking area to the east, and a series of four catch basins located in the north central portion of the site. These catch basins discharge to the Buffalo Sewer Authority combined stormwater/sanitary sewer system.

The site is currently owned by Downing Container Service, Inc. Figure 2 illustrates the current site plan. The property is bounded by Ganson Street to the west, Integrated Waste Systems, Inc. to the north, Roy Track, Inc. to the east, and General Portland, Inc. to the south and east. All the surrounding properties are industrial in nature.

Current zoning maps were not available for the site, however, based on the nature of the businesses in the area, it is presumed that the site and surrounding properties are zoned heavy industrial. The site is serviced by municipal water and a combined sanitary/storm sewer system. Other utilities include natural gas from National Fuel and electric from Niagara Mohawk. The gas is routed to the main building through underground pipes from Ganson Street. Electric is delivered through overhead lines from Ganson Street.

According to the *Soil Survey of Erie County, New York*, the project site is characterized as having urban soils (Ud). This indicates that 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structures. These areas are mostly nearly level to gently sloping.

Groundwater was encountered at the site in each of the monitoring wells. Static water levels measured in the monitoring wells ranged from 2.88 to 8.02 feet below ground surface. Regional groundwater flow direction, inferred from topographic maps, is generally towards the northwest and northeast to the discharge area represented by the Buffalo Ship Canal and the Buffalo River respectively. Local variations in groundwater flow, however, may occur in the site vicinity.

No. 360230 0020) was consulted to determine the flooding potential of this site. It was determined that the site is not located within the one-hundred year or five hundred year flood plains of any waterway, with the exception of the extreme southern tip of the property (< 10 percent), which slightly impinges on the five hundred year floodplain of the Buffalo River

3.0 PREVIOUS STUDIES

3.1 PHASE I ENVIRONMENTAL ASSESSMENT

AFI Environmental performed a Phase I Environmental Assessment (ESA) of the project site in September, 1993. This ESA was conducted in accordance with the procedures outlined in American Society for Testing and Materials (ASTM) Practice E1527-93. As a result, the following items were disclosed:

- o There is one RCRIS-TS (Treatment, Storage and Disposal) facility located within 1.0 mile radius of the site. This facility has numerous violations associated with ignitable wastes, heavy metals, and chlorinated solvents.

- o The waste hauling operation occupying the subject property was identified as a RCRIS-LG large quantity generator of the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o Additionally, one other RCRIS-LG large quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).
  - a solid waste that exhibits the characteristic of corrosivity, but is not listed as a hazardous waste (D002).

- o One RCRIS-SG small quantity generator is located within 0.25 mile radius of the site. This site generates the following waste types:

  - spent non-halogenated solvents (F003, F005); and
  - a solid waste that exhibits the characteristic of ignitability, but is not listed as a hazardous waste (D001).

- o The site itself is a listed petroleum bulk storage facility. Additionally, two petroleum bulk storage tank sites are located within a 0.25 mile radius of the subject property:

Printed on recycled paper to help protect the environment

- o There are three LST (Leaking Storage Tanks) sites located within 0.5 mile radius of the subject property.

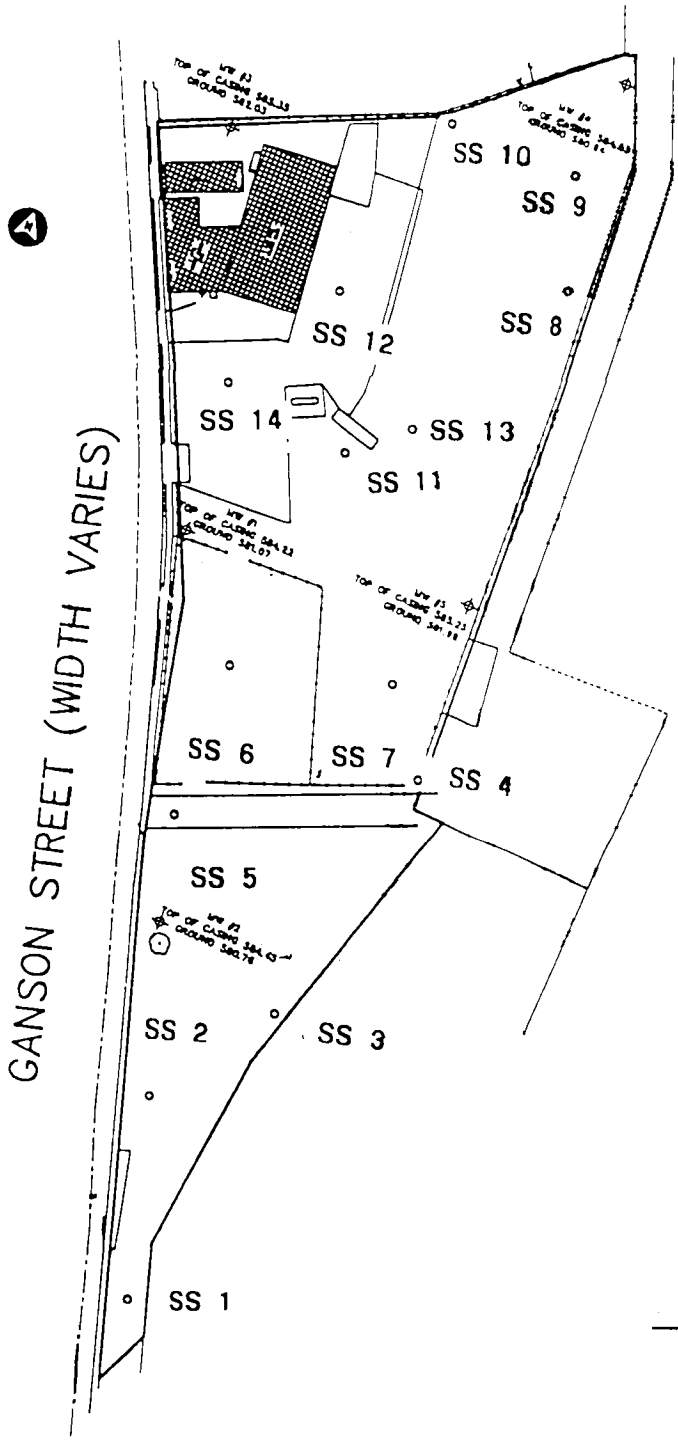
3.2 PHASE I CONCLUSIONS

In accordance with the conclusions drawn in the Phase I ESA Report, the property owner (Waste Management of New York), in consultation with AFI Environmental, elected to implement a Phase II investigation to examine the subsurface of the subject property. The purpose of the investigation was to determine the presence or absence of contamination on the site.

4.0 METHODS OF INVESTIGATION

The Phase II subsurface investigation was performed during the period of October 23 to November 2, 1994 with supplemental soil sampling conducted on December 6, 1994. This investigation was conducted in accordance with the investigation plan developed by AFI Environmental.

4.1 DRILLING, SOIL SAMPLING AND WELL INSTALLATION



Drilling, soil sampling and well installation procedures employed during this investigation as outlined in the following sections, are consistent with the collection of high quality data for hydrogeologic studies, and were selected based upon the collective experience of AFI Environmental staff and the drilling contractor, Advanced Drilling Investigations (ADI) of Niagara Falls, New York. All field work was directly supervised and documented by a qualified AFI Environmental Geologist, and the methods utilized were intended to minimize the potential for cross contamination. Five (5) groundwater monitoring wells and ten (10) soil borings were completed, and three (3) sediment samples collected at the site, the locations of which are depicted by Figure 3.

4.1.1 GROUNDWATER MONITORING WELLS

Overburden consisted of clayey silt, fine sand, silty sand, silty clay, and silty fine sand that was saturated at approximately 4-7 feet below ground surface. No odor or visual evidence of contamination was noted during drilling operations. The following paragraphs summarize the drilling, installation and design of these wells.

The installation of the wells was performed using a Mobile B-57 Drill Rig to advance 4 1/2" ID hollow-stem augers through unconsolidated geologic materials to a depth of approximately seventeen (17) feet. Soil samples were obtained continuously throughout the total depth of the boring using 2" OD split-barrel samplers in accordance with ASTM-D1586 procedures for Standard Penetration Test (SPT). Auger drilling proceeded with a steel plug inserted at the bottom of the auger stem to prevent material from entering the hollow stem and

to ensure accurate split-spoon sampling. The split-spoon sampler used was two (2) feet in length, unpainted, and equipped with a functional ball-check valve above the sample tube. The bottom of the sampling tube was equipped with a removable plastic "basket" retainer. The split-spoon was advanced through unconsolidated geologic materials at and below the bottom of the augers with a standard 140-pound hammer falling freely 30 inches. Blow counts were recorded for each six inches of penetration. Split-spoon samples were logged using the Unified Soil Classification System (USCS). Representative samples obtained from each split spoon were placed in appropriately labeled sample containers and immediately sealed with aluminum foil and screw on-cap. Field screening of soil samples obtained from split-spoons was conducted in accordance with the procedures outlined in Section 4.3.2.

Accurate test boring logs were prepared to document overburden stratigraphy and characteristics, depth to water, and all pertinent drilling observations.

Monitoring wells were installed immediately after auguring of the bore holes. The wells were constructed of two (2) inch diameter schedule 40, threaded, flush joint, PVC riser pipe and 10-slot PVC well screen. The screen was ten (10) feet in length, and fitted with threaded bottom plugs. The well screens were installed from approximately 7 feet below to 17 feet below the ground surface. A sand pack was gradually introduced to fill the annular space between the screen and the borehole wall. The sand pack extended from the bottom of the borehole to approximately one half (1/2) foot above the top of the screen. The sand pack consisted of washed, graded, silica sand with an average grain size and grain size distribution such that it was compatible with the screen slot size of 0.01 inches. A two (2) foot thick bentonite pellet seal was placed above the sand pack, and a cement/bentonite grout slurry extended from the top of the bentonite pellet seal to within one (1) foot of the surface. The well was completed by installing a six (6) inch steel casing with a stickup of approximately three (3) feet, with a locking cap. The grout was allowed to set up for 48 hours prior to well development. The well completion diagrams were prepared to document well construction details and material specifications and are included in Appendix A.

4.1.2 SOIL BORINGS

Ten (10) soil borings were installed manually using a three (3) inch bucket auger. Soil samples obtained from the bucket auger, from a depth of 0.5' to 1.0', were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as described in section 4.3.2. Each soil boring was abandoned following the completion of auguring/sampling activities by backfilling with auger cuttings from the respective borehole.

4.1.3 SEDIMENT SAMPLES

Three (3) sediment samples were collected from each of the three onsite catch basins. The samples were collected using a shovel to remove some material from the bottom of the catch basin. Each sediment sample obtained from the catch basins were immediately placed in properly labeled sample containers sealed with tin foil and a screw on cap for screening as

Printed on recycled paper
to help protect the environment

described in section 4.3.2. Excess material collected from the catch basins was returned to the bottom of the catch basins.

4.2 WELL DEVELOPMENT

The following well development procedures were employed 48 hours after completion of the groundwater monitoring wells. This allowed the cement/bentonite grout sufficient time to set-up and enabled the wells to equilibrate. Prior to evacuation procedures the water level within the wells was measured with an audible signal, water level indicator to facilitate calculation of the volume of water within the well. Water was then evacuated from the wells using a decontaminated, plastic bailer. Well development continued until a minimum turbidity was achieved. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

4.3 SAMPLE COLLECTION/SCREENING AND ANALYSIS

The sample collection/screening and analysis program implemented at the project site involved the collection of one (1) groundwater sample from each monitoring well; as well as the field screening of soil and sediment samples to enable the selection of two (2) soil samples from the ten (10) soil borings and one (1) sediment sample for chemical analyses. All sample collection and screening measures were performed in accordance with accepted protocols by an experienced AFI Environmental Geologist. All samples were placed in appropriately labeled sample containers for transport under proper chain of custody records to Lozier Laboratories for chemical analyses. The following sections outline sample collection and screening procedures, and identify the analytical methods employed to chemically characterize the groundwater and soil samples.

4.3.1 GROUNDWATER

After well development, the monitoring wells were allowed to equilibrate for 24 hours. The static water level within the monitoring wells were measured using an audible signal water level indicator. After calculating the volume of water contained within each well, purging was initiated. Purging was accomplished using decontaminated plastic bailers. Well purging continued until at least 3 well volumes were removed or a minimum of turbidity was obtained. All water withdrawn from the monitoring wells was properly contained within labeled, DOT approved 55 gallon drums to await proper disposal.

Groundwater sampling was performed within 24 hours after purging. The monitoring wells were sampled using decontaminated plastic bailers. The samples were placed in laboratory precleaned and prelabeled containers, appropriate preservatives were added, and the samples were placed on ice in a cooler for transport to Lozier Laboratories under proper chain of custody records. Five (5) groundwater samples underwent testing in accordance with EPA SW-846 3rd edition.

Printed on recycled paper
to help protect the environment.

4.3.2 SOIL

Soil samples obtained from split-spoons were screened for total organic vapors (TOVs) utilizing an HNu PID after equilibrating at room temperature for one (1) hour. After removing the screw on cap, the foil seal of the sample container was pierced with the probe of the PID, and a measurement was recorded. A summary of field screening results for VOCs is contained in Table #1. PID measurements were zero for all split spoon samples collected during monitoring well installation and ranged from 0 ppm to 0.7 ppm for the ten (10) soil and (3) three sediment samples.

Two (2) samples from the ten (10) soil borings and one (1) sediment sample from the three (3) drainage inlets were selected for chemical analysis based upon the results of field screening. The three (3) soil/sediment samples with the highest measured TOV concentration were placed in a laboratory precleaned and properly labeled sample containers and placed on ice in a cooler for transport under proper chain of custody records to Lozier Laboratories. All soil samples underwent testing in accordance with EPA SW-846 Method 8240 for VOCs, TCL Semi-VOCs by Method 8270, TCL Pesticides/PCBs by Method 8080, RCRA Metals by Method 6010/7000s , and Cyanide by Method 9012.

4.4 DECONTAMINATION

All drilling equipment such as augers, bits and sampling equipment which came in contact with subsurface materials was decontaminated via steam cleaning before and after drilling activities at each borehole. Equipment decontamination consisted of the removal of all soils with a high pressure, low volume, steam and detergent wash. Split-spoon decontamination was performed between samples and consisted of a detergent wash and potable water rinse.

The AFI geologist supervising the field investigation ensured that all equipment was properly decontaminated prior to use at the site, between each borehole, and before leaving the site.

4.5 CONTAINMENT OF WASTES

Drill cuttings from the installation of the monitoring wells were transferred into labeled DOT-approved 55 gallon drums to await proper disposal. Similarly, all decontamination fluids and liquids withdrawn from the groundwater monitoring wells during development, purging and sampling activities were contained within labeled DOT-approved 55 gallon drums to await proper disposal by the client.

5.0 ANALYTICAL RESULTS

5.1 SOIL

Printed on recycled paper
to help protect the environment

The Lozier laboratory report containing the analytical results for the soil samples analyzed via EPA SW-846 Method(s) 8240, 8270, 8080, 6010/7000 and 9012 are presented in Appendix C. This report also contains the case narrative, laboratory quality assurance/quality control (QA/QC) data, and chain of custody records. An initial review of the data indicated that the holding times for the 8080 Pesticides/PCBs and the TCL Semi-VOCs 8270 soil samples were exceeded prior to analysis. These samples were destroyed and resampled on December 6, 1994. All data reported within this report was analyzed within the required holding times, laboratory blanks were free of contamination, and all QC data were acceptable. These data are summarized and discussed in Section 6.0.

5.2 GROUNDWATER

The results of the chemical analysis of the five (5) groundwater samples collected from the onsite monitoring wells are presented in Appendix D. Additionally, the case narrative, laboratory QA/QC data and chain of custody records for these samples are presented therein. All groundwater samples were analyzed within the required holding times, surrogate standard recoveries were within acceptable limits (except for the low acid recoveries due to matrix interference on method 8270 for samples 1,3,4,5 and sample 6 for method 8080), and laboratory blanks were free of contamination. Section 6.0 contains a summary and evaluation of these groundwater data.

6.0 CONTAMINATION ASSESSMENT

An evaluation of the data resulting from the chemical analysis of soil and groundwater samples collected from the project site, including data from previous studies, was performed with respect to the following:

- o Type of Contamination
- o Potential Sources of Contamination
- o Compliance with Applicable Regulatory Guidelines

The succeeding subsections provide an assessment of the subsurface conditions at the project site, based upon available data, and provide the foundation for the recommendations concerning further investigation and/or remediation of the site discussed in Section 8.0.

6.1 SOIL

Analytical results from the two (2) soil samples and one (1) sediment sample collected from the project site have indicated the presence of a number of volatile organic compounds (VOCs) and semi volatile organic compounds (SEMIVOCs) commonly associated with petroleum contstituents, possibly from fuel oil. Table 2 presents a summary of these results in a comparative format which includes the guidance values for each parameter as specified in the NYSDEC publication: *Spill Technology and Remediation Series (STARS) Memo #1 and/or*

Printed on recycled paper
to help protect the environment

NYSDEC Soil Cleanup Objectives and Cleanup levels TAGM (January 24, 1994). As illustrated by Table #2, and discussed within the laboratory case narrative, all sediment samples were diluted, prior to analysis, due to the presence of a brown viscous petroleum hydrocarbon within the sample extract. The dilution of the sample raised the detection limits far above the NYSDEC guidance values by several orders of magnitude. Further, PCB-1260 was detected at all locations sampled and analyzed, with the highest concentration at location # 9.

Based upon the location from which soil samples containing significant concentrations of VOCs and SEMIVOCs were collected; one can assume that impacts to the soil near the former UST location (location #10) and the fueling/container staging area (location #11) has occurred as the results of minor spillage or leaks. This assumption is consistent with the field screening data presented in Table #1. A further review of the same table reveals that not all samples locations exhibited VOC's. This may indicate that the impacts from the petroleum releases to the soil is limited. This assumption is supported by the lack of VOC's during the screening of the split spoon samples and the lack of any VOCs in the groundwater samples collected from the site. Therefore one could assume that not all areas of the site are contaminated with petroleum constituents.

6.2 GROUNDWATER

The chemical analysis of groundwater samples collected from the overburden monitoring wells installed on the site, did not indicate the presence of petroleum constituents in exceedance of NYSDEC guidance values. These data are summarized in Table #3. Based on a comparison with applicable guidance values established by the NYSDEC STARS Memo #1 and NYSDEC TAGM dated January 24, 1994, it appears that none of the contaminants encountered in the soil/sediments have entered the groundwater at any of the areas monitored. Further, it appears that contaminants originating from areas off-site are not migrating on-site via the groundwater flow system and that onsite contaminants are not migrating offsite via the groundwater system.

7.0 CONCLUSIONS

AFI Environmental collected a total of three (3) soil/sediment and five (5) groundwater samples from the project site for analysis pursuant to NYSDEC Petroleum-Contaminated Soil Guidance Policy. The resulting analytical data was assessed to determine if contaminated soil was present and to characterize groundwater quality. In general, contaminated soil was encountered in varying degrees in the areas sampled. In this case we don't know that the values exceed the NYSDEC requirements because of the analytical method selected for analysis. It isa possible that some of the particular constituent levels could exceed the NYSDEC STARS limits, but this is unknown because TVLP analysis was not performed. The area of the former UST (sample location #10) demonstrated higher levels for VOCs and SEMIVOCs, than the truck fueling/waste container staging area (sample location #11). However, the sludge/sediment sample (sample location # 14) collected from the surface water runoff collection inlet was highest of all, especially for Acetone and Toluene (39,000 and 62,400 ppb respectfully). PCB-1260,

Printed on recycled paper to help protect the environment.

normally of low mobility, was detected in all samples, with the highest value recorded in the staging/refueling area. PCBs may be resulting from fill brought on-site prior to Downing Container's existence, or it maybe a result of current activity and made mobil via the liquid petroleum fraction in the soils.

Groundwater samples collected from the five (5) overburden monitoring wells were clean. No contravention of NYSDEC guidance values for drinking water standards, in the areas monitored, has occurred. The placement of the monitoring wells near the periphery of the site indicates that no contaminants are entering or leaving the site via the groundwater flow system of the overburden, in the areas monitored.

8.0 RECOMMENDATIONS

Based upon the analytical data generated during the course of this investigation and a review of NYSDEC Petroleum-Contaminated Soil Guidance Policy, AFI Environmental recommends that a more extensive soil/sediment investigation be conducted. The objective of this program, would be to determine the concentrations, distribution (horizontal and vertical) and source of petroleum and PCB-1260 constituents in the soil. Once the boundaries, source and extent of the constituents, are defined, a corrective action program could be implemented. This would allow remediation of the site soils to within levels that are protective of human health and the environment.

However, recognizing that the site is located in a highly industrialized area and that the site is not currently leaching constituents into the groundwater or offsite via groundwater, a combination of testing, soil remediation, and paving with asphalt, concrete, or other impermeable semi-permanent material may warrant consideration.

The ultimate selection of the remedial method should be based upon further soil investigation and a number of parameters, including but not limited to effectiveness, potential impacts to human health and the environment, cost, and compatibility with the current commercial nature of the site. AFI also recommends that the NYSDEC be consulted regarding acceptable clean-up levels at the site, as well as the means by which these objectives will be achieved; once additional data has been collected and reviewed.

9.0 LIMITATIONS

This report is based upon the application of scientific principles and professional judgement to certain facts with resultant subjective interpretations. Professional judgements expressed herein are based on the facts currently available within the limits of the existing data, scope of services, budget and schedule. To the extent that more definitive conclusions are desired by the client than are warranted by the current available facts, it is specifically AFI

* NYSDEC Guidance Values from Jan 24, 1994 TAGM-Determination of Soil Cleanup Objectives and Cleanup Levels. HWR94-4046.

Allowable soil concentrations may be increased by a factor of 100 if the contamination is in the unsaturated zone above the water table. The value of 100 for correction is consistent with the logic used by EPA in its Dilution Attenuation Factor (DAF) approach for EP Toxicity and TCLP. (reference TAGM HWR94-4046).

Soil cleanup objectives are obtained by multiplying the allowable soil concentration by the correction factor.

CASE NARRATIVE
FOR LOZIER LABORATORY REPORT 94116329

PROBLEM TYPE:

H - HOLDING TIME	D - DILUTION
T - TUNE	I - INTERNAL STANDARDS
S - SURROGATES	M - MS/MSD/MSB
B - BLANKS	X - _____
C - CALIBRATION	Y - _____
D - DUPLICATES	Z - _____

PROBLEM	SAMPLE	ANALYST'S COMMENTS
D	1,2,3	The sample extracts were dark brown and viscous. The presence of petroleum hydrocarbons in the analysis precludes lower reporting levels.

Re: Removal & Disposal
of Underground Tank

Gentlemen:

Please be advised that the Elmwood Tank & Piping Corporation has been awarded the contract to clean, gas free and legally dispose of the following underground tank and its contents, as per D.E.C. Regulations, at the listed location:

LOCATION: Downing Container Service
191 Ganson Street
Buffalo, New York

SIZE: 1-4,000 Gallon Steel Tank

We are proceeding with the removal of the aforementioned underground tank on November 24, 1987 in accordance with your verbal approval of our telephone conversation of November 18, 1987.

If you require further information, please do not hesitate to contact us.

Very truly yours,

ELMWOOD TANK & PIPING CORP.

BUFFALO,NY 14203

Description:

The first emission point is a Metso Model LT1213S crusher/screener with two associated transfer belts to recover construction debris. The system is rated at approximately 350 tons per hour and is equipped with a water mist to control emissions of airborne particulates. Compliance with the particulate matter standards in 40 CFR Part 60.672(a) was determined by successfully performing a Method 9 on November 16, 2006. The procedures in 40 CFR Part 60.11 were used to determine opacity. As per 40 CFR 60.672(b), each transfer point is subject to a fugitive emissions opacity limit not to exceed 10%. Additionally, the crusher is subject to 40 CFR 60.672(c) which limits its fugitive emissions to 15% or less. The crusher is also subject to the requirements of 6NYCRR Part 212.
The second emission point is a 515 Hp diesel motor which is used to power the crusher.

Total Number of Emission Points: 2 **Cap By Rule:** No

Authorized Activity By Standard Industrial Classification Code:

1429 - CRUSHED AND BROKEN STONE NEC

Registration Effective Date: 05/08/2009 **Registration Expiration Date:** (Not Applicable)

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by TurnKey Environmental Restoration, LLC. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

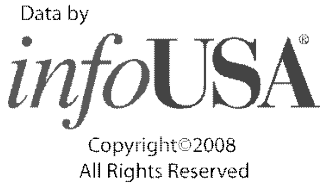
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1925 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.
