1.0 INTRODUCTION

Beacon Communities Services LLC has obtained an executed Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) as a volunteer for the 375 Michigan Avenue Project (Site) located at 375 Michigan Avenue, City of Buffalo, Erie County, New York. The Site is associated with Brownfield Cleanup Program (BCP), SBL No. 111.63-1-1.11 and BCP Site No. C915417. Beacon Communities Services LLC has contracted Brydges Engineering in Environment and Energy (BE3) to conduct a Remedial Investigation (RI) as required by the BCA. The total BCP Site area is approximately 2.15 acres. A site location map is provided as **Figure 1** and the site survey as **Figure 2**. A project schedule is provided on **Figure 10**.

The RI was completed in accordance with BCP requirements as defined in Section 375-3.8 of the NYSDEC 6 NYCRR Part 375 Environmental Remediation Program Regulations. It is anticipated that the remedial measure selected will lead to a site remedy as defined in Part 375-1.8(g)(2)(ii), achieve soil cleanup objectives (SCOs) as defined in Part 375-6.8(b) and mitigate environmental impacted media issues at the Site.

1.1 SITE BACKGROUND

The 2.15-acre Site encompasses one parcel located at 375 Michigan Avenue, Buffalo, Erie County, New York. The associated SBL number is 111.63-1-1.11. The middle of the 375 Michigan Avenue parcel is located at latitude 42º52’57.23” N; Longitude 78º52’5.63” W and is 603 feet above sea level. The Site is zoned N-2E (Mixed-Use Edge) and bounded by East Eagle Street to the north, South Division Street to the south, Michigan Avenue to the west and Minnie Gillette Drive to the east. The Site has been vacant since approximately 2021. The Site is located near the eastern end of the downtown business district which predominantly contains commercial/office space with some buildings converted to mixed use residential. This Site is also located in a designated Type AB En-zone under census Tract 14.03, a disadvantaged community (DAC) and a potential environmental justice area. The BCP Applicant, Beacon Communities Services LLC, has entered the program as a Volunteer to remediate the Site in preparation for redevelopment of the property.

Environmental assessments and investigations conducted on the Site concluded that there are impacted soils across the Site primarily due to the Site’s former use and the presence of urban fill. Previous subsurface sampling identified soils impacted with metals and semi-volatile organic compounds (SVOCs), primarily polycyclic aromatic hydrocarbons (PAHs).

The Site is currently occupied by a vacant building most recently used as Sunrise II Minimart in the northwest portion of the property at the southeast corner of Michigan Street and East Eagle Street. The one-story, 2,352 square foot slab-on-grade structure was constructed in 1997. The remaining area of the property is vacant, grass covered land. Large sized gravel and a few small patches of asphalt were observed across the property and are the remains of its former use as a parking lot. Prior to beginning RI fieldwork, the on-site parking lot was marked and considered restricted. Local area topography is generally level. Surface relief in the immediate vicinity of the property is relatively uniform, with overall gentle downward slopes to the south-southwest towards Lake Erie.

Historic maps indicate that an auto repair shop and gas station were located where the current vacant mini mart sits on the northwest corner of the Site from the 1930s to the 1950s. Whether the underground storage tanks (USTs) associated with the historic gas station have been

DRAFT

removed is not currently known. This data gap represents a potential source of ongoing and historic contamination of the Site. In addition, an electrical storage/repair shop was historically located on the Site from at least 1930 to at least 1955. The parcel at 383 Michigan Street, which is now part of the Site located south of the vacant mini mart along the western portion of the Site, was a tailor. In 1950, Rear Twin Cleaners was also listed as operating on this portion of the Site. Both historic operations could serve as a source of historic contamination due to the use of various hazardous materials for cleaning purposes. Historical records indicate that the Site was a large parking lot from the late 1950's through the 1990s.

1.2 Identification of standards, Criteria, and Guidance

Standards, criteria, and guidance (SCGs) are promulgated requirements ("standards" and "criteria") and non-promulgated guidance ("guidance") that govern activities that may affect the environment and are used by the NYSDEC at various stages in the investigation and remediation of a site. The following are the primary SCGs for this project:

- NYSDEC 6 NYCRR Part 375 Environmental Remediation Programs, December 2025.
- NYSDEC DER-10 Technical Guidance for Site Investigations and Remediation, May 2010.
- NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, June 1998.
- NYSDEC Commissioner Policy (CP)-51 Soil Cleanup Guidance, October 2010.
- NYSDEC Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS), April 2023.
- NYSDEC 6 NYCRR 360 Solid Waste Management Facilities General Requirements, August 2020.
- New York State Department of Health (NYSDOH) Guidance for Evaluating Soil Vapor Intrusion, May 2017 updated February 2024.

2.0 REMEDIAL INVESTIGATION APPROACH

The RI was conducted in general accordance with the June 2026 *Remedial Investigation Work Plan, Beacon Communities Services LLC, 375 Michigan Avenue, City of Buffalo, New York, Site No. C915417*, The NYSDEC issued an approval letter for the RIWP on June 25th, 2026. All boring, vapor points, monitoring wells and surface sampling locations were installed at the approximate locations depicted in the approved RIWP. Actual sampling depths were based on field conditions encountered during the RI and are discussed herein. Any deviations from the RIWP are provided in Section 2.5.

RI activities included the following:

- *Geophysical Survey*
- *Soil boring*
- *Test Trenches*
- *Overburden groundwater monitoring well installation*
- *Vapor point installation (underground, ambient indoor/outdoor, and sub-slab)*
- *Soil, groundwater and soil vapor sampling*
- *Building Environmental Condition Assessment*
- *Gamma Radiation Survey*

All on-site staff work directly under the supervision of a qualified environmental professional (QEP) during all intrusive field activities. For prior field work, the utility locate center was contacted to mark buried utilities on the Site. A geophysical survey was also performed on the site prior to beginning any intrusive work to identify any buried objects. The approximate locations of Phase II ESA sampling locations are shown on **Figure 3/Figure 4** and RI Investigation/sample locations are shown on **Figure 5**. Precise global positioning coordinates (GPS) for RI sampling locations are provided in **Table 7**. Daily field reports (DFRs) which detail site conditions/activities and contain an associated photolog and work location map are contained in **Appendix A**. Additional Site photographs are included in **Appendix B**.

A Community Air Monitoring Program (CAMP) was implemented in accordance with NYSDOH DER-10 guidance throughout the duration of intrusive RI fieldwork. Real-time monitoring was conducted for particulate matter (dust) and total volatile organic compounds (VOCs). Downwind particulate levels did not exceed 100 micrograms per cubic meter (µg/m3) greater than background concentrations (upwind particulate levels) for any 15-minute period. Concentrations of total organic vapors did not exceed 5 parts per million (ppm) above background levels at the work area for any 15-minute period. The particulate monitoring data is included as an attachment to the DFRs provided in **Appendix A**.

2.1 GEOPHYSICAL SURVEY

A geophysical survey was performed over the Northern portion of the site extending about 250ft south from East Eagle Street along the Northern boundary of the site. Five geophysical anomalies were observed during the walkover; these were investigated during field activities. See Section 3.2.1 and **Appendix H** for more information about the results of this survey.

2.2 SOIL INVESTIGATION

The soil investigation was composed of soil borings, test trenches, and surface soil sampling at select locations across the Site (see **Figure 5**).

2.2.1 Soil Boring Sampling

Between June 30 and July 1, 12 soil borings denoted RI-BH-1 through RI-BH-12 were completed across the Site.

A track-mounted Geoprobe® 7720DT direct-push drilling rig was utilized to complete the borings. The borings were positioned around the Site to provide representative coverage of the fill and native soil material. The coordinates of the soil borings are denoted in **Table 7** and can be seen in **Figure 5**. The final depths of the Geoprobe and the depths and regime at which sampling occurred are as follows.

Soil Boring	Total Depth of Probe (bgs)	Sampling Depth (bgs) and Regime
RI-BH-3 RI-BH-4 RI-BH-9 RI-BH-10 RI-BH-11	8’	Fill 1-3’
RI-BH-1 RI-BH-2 RI-BH-8 RI-BH-12	15’	Fill 1-3’
		Native 8-10’
RI-BH-5 RI-BH-6 RI-BH-7	8’	Fill 1-3’
		Native 4-6’

All soil samples were visually evaluated for soil type and field screened for VOCs immediately following retrieval and opening of the sampling sleeves using a photoionization detector (PID). Screening was accomplished by holding the PID over the sample/core and recording the highest reading.

Soil samples were placed in appropriate containers, packaged in coolers with ice, and transferred to Eurofins Environment Testing – Buffalo, a NYSDOH Environmental Laboratory Approval Program (ELAP) certified laboratory, using standard chain-of-custody procedures.

2.2.2 Test Trech Soil Sampling

0n June 30, six test trenches denoted RI-TT-1 through RI-TT-6 were completed across the Site. A mini excavator was utilized to complete the test trenches. The trenches were positioned around the Site to provide representative coverage of the fill and native soil material. The coordinates of the test trenches are denoted in **Table 7** and can be seen in **Figure 5**. The final depths of the trenches and the depths at which sampling occurred are as follows.

All 6 test trenches were completed to a depth of 6ft bgs. Samples were collected in each test trench at 1-3ft bgs and 4-6ft bgs.

2.2.3 Surface Soil Sampling

A total of 9 surface soil samples were collected at 2+ inches below vegetative cover in areas where previous investigations identified soil impacts in near surface soil samples. Samples were collected at borehole locations RI-BH-1 to RI-BH-4, RI-BH-8 to RI-BH-12.

2.2.4 Monitoring Well Soil Sampling

Soil samples were collected from each of the four monitoring wells (RI-MW-1 to RI-MW-4) during monitoring well installation. These samples were collected from the screen interval for each well to assess potential contaminant correlations/pathways between the overburden and underlying groundwater. RI-MW-1 and RI-MW-2 were sampled from 15'-20' bgs. RI-MW-3 was sampled twice, once from 15'-20' bgs and again at screen depth from 20'-25' bgs. RI-MW-4 was sampled from 20'-25' bgs.

2.2.5 GAMMA RADIATION SURVEY

A gamma radiation survey was conducted due to the presence of slag in test trench RI-TT-4, no further action will be needed as gamma radiation levels in this area did not exceed background results. See **Appendix I** for more information about the results of this survey.

2.3 GROUNDWATER INVESTIGATION

Between June 29th and June 30th, 2026, a total of four overburden monitoring wells were installed (RI-MW-1 To RI-MW-4).

2.3.1 Overburden Monitoring Well Installation

Four overburden monitoring wells were installed using a track-mounted Geoprobe® 7720DT with a hollow stem auger drilling technique. A 4.25-inch hollow stem auger was used to drill to depths approximately 20' bgs for MW-1/MW-2 and 25' bgs for MW-3/MW-4. Locations of the wells are shown in **Figure 5.** All monitoring wells were constructed using 2-inch inside diameter (ID), flush joint, Schedule 40 polyvinyl chloride (PVC), with 0.010-inch slotted screen at 5.0 feet in length. All wells were flush mounted with lockable caps. Well construction logs are provided in **Appendix D**.

2.3.2 Well Development

Monitoring well development was conducted using a disposable polyethylene bailer. Dedicated equipment was used for each specific well where possible. Development continued until the maximum practical volume of groundwater was removed; however, slight turbidity remained due to the low recharge rate and fine-grained formation materials. All development and decontamination water was containerized in NYSDOT-approved drums and labeled according to the well of origin, then properly secured after use.

No light non-aqueous phase liquid (LNAPL), dense non-aqueous phase liquid (DNAPL), sheen, or notable odors were observed during development. Field parameters—pH, temperature, turbidity, dissolved oxygen (DO), oxidation-reduction potential (ORP), specific conductance, flow

rate, and water level—were recorded periodically for stabilization and health and safety monitoring. Visual and olfactory screening and photoionization detector (PID) readings were also conducted.

Final determination regarding the proper disposition of development water (e.g., on-site treatment, off-site disposal, or surface discharge with NYSDEC approval) will be made based on laboratory analytical results and procedures will be described in the RAWP. Well development logs are provided in **Appendix E**.

2.3.3 Groundwater Sampling

Groundwater sampling of overburden wells was conducted on July 9 and 10, 2026. Low-flow sampling techniques were employed using a low flow peristaltic pump and dedicated tubing in accordance with NYSDEC-approved procedures.

Field parameters were continuously monitored throughout purging and sampling, consistent with the protocol described in Section 2.2.2. Sampling commenced once stabilization criteria were met, and turbidity levels were confirmed to be below 50 Nephelometric Turbidity Units (NTU).

Samples were placed in laboratory-supplied containers, preserved as required, packed in iced coolers, and submitted under chain-of-custody to Eurofins Environment Testing – Buffalo, a NYSDOH Environmental Laboratory Approval Program (ELAP) certified laboratory. Purge logs are included in **Appendix F**.

2.4 VAPOR INVESTIGATION

The vapor investigation was conducted in accordance with the October 2006, New York State Department of Health *Guidance for Evaluating Soil Vapor Intrusion in the State of New York,* as amended in May 2017 updated Feb. 2024.

2.4.1 Vapor Point Installation

On June 30th and July 1st, 2026, seven vapor points (RI-VP-1 through RI-VP-7) were installed across the Site (See **Figure 5)**. Vapor points were advanced using a track-mounted Geoprobe® 6011DT direct push drilling rig. Locations were selected to provide representative site coverage, particularly in areas with a history of potentially impacted soil or fill placement. Vapor points RI-VP-1, RI-VP-3, RI-VP-5, and RI-VP-7 were placed at 12.0ft bgs. Vapor points RI-VP-2, RI-VP-4, and RI-VP-6 were placed at 5ft bgs. Each vapor point consisted of a ¼-inch outer diameter polyvinyl chloride (PVC) tubing fitted with a 3/8-inch stainless steel mesh screen at the base. The screened interval was surrounded with clean, porous #0 sand to a depth of approximately 2 feet, followed by a bentonite seal, ranging in thickness from 3 to 10 feet, to isolate the probe and prevent preferential pathways for vapor migration along the boring annulus. Vapor point construction details are documented in **Appendix G**.

The sub-slab vapor point (RI-SS-1) was installed inside the existing building utilizing a portable hammer drill to penetrate the concrete slab. A 5/8” drill bit as utilized to extended through the thickness of the slab and approximately 2” into the sub-slab material. The shallow 5/8” drilled hole was cleaned using a round steel wire brush and the surface of the adjacent concrete was cleaned using a flat wire brush to remove any residual concrete dust from the floor’s surface. A

Vapor Pin® was then positioned into the drilled hole and tapped into place with a dead blow hammer and temporarily capped to prevent vapor loss prior to sampling.

An ambient air canister was placed next to the sub-slab canister inside the existing building, RI-IA-1. Another ambient air canister was placed outside the building, RI-UP-1.

2.4.2 Soil Vapor Sampling

Sampling was conducted over a 24-hour period from June 4 to June 5, 2025, using 6-liter SUMMA® canisters equipped with calibrated 24-hour regulators. All sampling activities were performed in accordance with the latest NYSDOH Guidance for Evaluating Soil Vapor Intrusion. Vapor sample depths were as follows:

Sample ID	Sample Depth (ft bgs)
RI-VP-1	10 to 12
RI-VP-2	3 to 5
RI-VP-3	10 to 12
RI-VP-4	3 to 5
RI-VP-5	10 to 12
RI-VP-6	3 to 5
RI-VP-7	10 to 12

2.5 Building Environmental Condition Assessment

One existing building will be demolished and removed as part of the new development. A Pre-Demolition Asbestos and Hazardous Materials Survey will be completed prior to the demolition. All demolition debris will be properly sorted, characterized, and disposed of at an approved landfill or recycling facility.

At the time of the Remedial Investigation, the Site contained an existing former mini-mart building that remains on-site, with demolition to be planned as part of future site redevelopment activities. A visual inspection of accessible portions of the building was performed to identify potential environmental concerns associated with the structure. No visible floor drains or sumps were observed within the building, and no other apparent pathways for the discharge of liquids to the subsurface were identified.

2.6 RI Deviations

One test trench and two bore hole locations were moved due to concerns of contamination brought up by the NYSDEC during the RI and possible UST found during the geo-physical survey (**Appendix H)**.

Test trench 3 (RI-TT-3) was moved to the NE edge of the site to explore a geophysical anomaly (see **Appendix H)**. A large amount of construction debris was found in this new location. Bore Hole 4 (RI-BH-4) was moved West to cover the original location of Test Trench 3.

Bore Hole 2 (RI-BH-2) was moved North to further explore contamination concerns found in Test Trench 1 (RI-TT-1).

A gamma radiation survey was conducted around test trench 4 due to the presence of slag (see **Appendix I)**.

2.7 QUALITY ASSURANCE/QUALITY CONTROL SAMPLING

Project-specific quality assurance/quality control (QA/QC) samples were collected during the soil and groundwater investigations as outlined in the approved RIWP. The purpose of these samples is to achieve the data quality indicators of precision, accuracy, representativeness, comparability and completeness. Additionally, this data is necessary to assist the third-party data usability assessment necessary to complete the Data Usability Summary Reports (DUSRs). Laboratory analytical reports and DUSRs are in **Appendix K** and **Appendix L**, respectively, and are provided as separate attachments.

3.0 PHYSICAL CHARACTERISTICS OF THE AREA

3.1 SURFACE FEATURES

The 2.15-acre Site encompasses one parcel located at 375 Michigan Avenue, Buffalo, Erie County, New York. The associated SBL number is 111.63-1-1.11. The middle of the 375 Michigan Avenue parcel is located at latitude 42º52’57.23” N; Longitude 78º52’5.63” W and is 603 feet above sea level.

The Site is generally flat and gently sloping south. Surface water and shallow groundwater flow most likely has been impacted over time by the various developments and fills as well as foundations, street beds, and utility lines. Surface water is directed to adjacent streets and low spots with storm drains. The topography of the site is show on **Figure 2**.

3.2 SUBSURFACE FEATURES

3.2.1 GEOPHYSICAL SURVEY

A geophysical survey was performed over the entire Northern portion of the site extending about 250ft south from East Eagle Street along the Northern boundary of the site. Five geophysical anomalies were observed, see **Appendix H** for the geophysical survey results. No USTs were found at anomaly locations during the RI.

3.2.2 SITE GEOLOGY

Subsurface conditions at the Site were evaluated through four phases of investigations. In August 2020 a Phase II ESA was conducted. In July 2024 a Phase II ESA was to assess eligibility for the BCP. The subsurface soil assessment identified the existence of fill materials across the site. In January 2026, six additional test pits were completed to better characterize the subsurface. During the RI, an additional 12 soil borings, 6 test trenches, and 4 overburden monitoring wells were completed in June/July 2026.

The soil borings indicate that the site is generally underlain by 1.5 to 5 feet of urban fill consisting of brown to black Sandy Gravel with little clayey silt and urban fill debris (brick, ash, cinders, concrete, glass, plastics, and clay piping). Beneath the fill, the native material consisted of brown Clay & Silt with little sand. Soil boring logs are provided in **Appendix C**, and well construction logs in **Appendix D**.

During advancement of the bore holes and monitoring wells, bedrock was not encountered.

3.2.3 SITE HYDROGEOLOGY

Groundwater conditions at the Site were evaluated using four overburden monitoring wells (RI-MW-1 through RI-MW-4). Monitoring wells RI-MW-1 and RI-MW-2 are screened from approximately 10 to 20 feet bgs, while RI-MW-3 and RI-MW-4 are screened from approximately 15 to 25 feet bgs. Site native soils generally consists of relatively low-permeability, clay-rich soils.

Depth to groundwater, the monitoring wells ranged from approximately 12.5 to 16.0 feet below the top of well casing. Based on surveyed top-of-casing elevations, calculated groundwater elevations ranged from approximately 587.20 to 589.73 feet. Groundwater elevations were 588.57 feet at MW-1, 587.20 feet at MW-2, 589.73 feet at MW-3, and 587.29 feet at MW-4. Groundwater Elevation contours are shown on **Figure 9.**

The groundwater elevation data indicates variability in hydraulic head across the Site, with the highest measured groundwater elevation occurring at RI-MW-3 and the lowest occurring at RI-MW-2. A localized potentiometric high appears to be present in the vicinity of RI-MW-3, with groundwater elevations generally decreasing toward RI-MW-2 and RI-MW-4. The observed variability may reflect the relatively low permeability and heterogeneous nature of the overburden soils, which can limit hydraulic communication across the Site.

3.3 DEMOGRAPHY AND LAND USE

375 Michigan Ave. Project will be a transit-oriented affordable housing development bordering on the City of Buffalo's eastside community and the downtown central business district. This infill new construction project will provide up to 158 affordable rental units for one-, two-, and three-bedroom households with incomes at or below 50% and 60% of the area median income (AMI), utilizing the federal Low-Income Housing Tax Credit ("LIHTC"). The existing one-story, 2,352 square foot slab-on-grade structure will be demolished to make way for the new development. Demolition will not occur as part of the RI. Demolition will occur approximately one month after Homes and Community Renewal (HCR) finance closing which will not occur until a Decision Document (DD) is obtained from NYSDEC. The proposed post-remediation use is consistent with the current zoning.

5.3 VAPOR SAMPLE ANALYTICAL RESULTS

The following provides a summary of the results of the RI soil vapor sample analytical program. All soil vapor samples were collected in accordance with the *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*-Amended May 2017 and updated Feb. 2024. A total of Eight soil vapor samples were analyzed for TCL VOCs by EPA method TO-15 and the results are provided on **Table 6** and **Figure 7**. Numerous detections of VOCs were found in the soil vapor. Although there were numerous detections, the concentrations of these detections are not considered elevated. In performing a sub-slab vapor (RI-SS-1)/indoor air (RI-IA-1)matrix analysis, no VOC compounds included in the matrices called for mitigation but were all assessed at no further action.

5.4 CONTAMINANTS OF CONCERN

Based on the RI and previous environmental investigation results, the primary contaminants of concern (COC) in Site media are noted below.

5.4.1 SOIL

The primary COC in Site soils are metals and SVOCs (PAHs). Specific contaminants are as follows:

Metals

- Mercury
- Lead
- Arsenic
- Barium
- Manganese

SVOCS

- Benzo[a]anthracene
- Benzo[a]pyrene
- Benzo[b]fluoranthene
- Benzo[g,h,i]perylene
- Benzo[k]fluoranthene
- Chrysene
- Dibenz(a,h)anthracene
- Fluoranthene
- Indeno[1,2,3-cd]pyrene
- Phenanthrene

- Pyrene

5.4.2 GROUNDWATER

Sodium, Manganese and iron were detected above guidance values; however, these metals can be naturally occurring and are not considered contaminants of concern. The Organochlorine Pesticide Aldrin was detected in low concentration. These exceedances are considered minimum and therefore, no contaminants of concern are considered in groundwater.

5.4.3 SOIL VAPOR

VOCs were detected in soil vapor samples and sub-slab samples. Specific elevated soil vapor samples included Carbon tetrachloride and Cyclohexane. Specific elevated sub-slab samples included Cyclohexane. All other vapor detections are not considered elevated. In performing a sub-slab vapor (RI-SS-1)/indoor air (RI-IA-1)matrix analysis, no VOC compounds included in the matrices called for mitigation but were all assessed at no further action.

5.5 DUSR ASSESSMENT

Data validation concluded that all analytical data was usable except for a few soil pesticide compound concentrations which were rejected as unusable. Most of the rejected results were for compounds that do not have SCO values (no standard). Several compound concentration results were assessed as estimated quantities and deemed biased high or low by validation but did not change the data results as provided in the lab reports. DUSR's are provided in Appendix L.

6.0 FATE AND TRANSPORT OF CONTAMINANTS OF CONCERN

The soil, groundwater and soil vapor sample analytical results were incorporated with the physical Site conditions to evaluate the fate and transport of COC in Site media. The mechanisms through which the COC can migrate to other areas or media are briefly outlined below. The potential pathways are evaluated in the context of pre-remedial conditions.

6.1 FUGITIVE DUST

Contaminants present in soil can be released into ambient air due to fugitive dust generation from disturbance of dry friable soils. Besides the small 2000+ sf building the Site is grass covered with small sections of stone/asphalt parking areas. This current coverage limits any fugitive dust generation.

6.2 SURFACE WATER

There are no surface water bodies directly on the Site. The potential for impacted soil particle transport with surface water runoff is considered low due to the hard scape and vegetative cover over the Site. Most runoff is collected in the municipal stormwater collection system within streets bordering the Site.

6.3 VOLATILIZATION

No VOCs were detected above Restricted Residential SCOs in soil samples from the RI or previous investigations. Acetone was detected slightly above its Unrestricted SCOs in several RI soil samples but maybe attributed to the fact that its compound often found in laboratory equipment cleaning process. Groundwater samples collected from on-site wells during the RI

indicated that VOCs are not present in groundwater above TOGS 1.1.1 guidance values. Numerous detections of VOCs were found in soil vapor samples and the sub-slab vapor sample, including chlorinated volatile organic compounds and petroleum hydrocarbons. In performing a sub-slab vapor (RI-SS-1)/indoor air (RI-IA-1)matrix analysis, no VOC compounds included in the matrices called for mitigation but were all assessed at no further action. Specific elevated VOCs are discussed in section 5.4.3.

6.4 LEACHING

Leaching refers to contaminants in soil/fill migrating into groundwater due to infiltration of precipitation. VOCs were not detected in the soil samples above Restricted Residential SCOs and only Acetone exceeding Unrestricted SCOs in a few samples, however, both SVOCs (primarily PAHs) and metals were detected in the site soils above restricted residential SCOs. PAHs and metals are not very mobile in soils in that they have low solubility with water and tend to adsorb to the soil grains. SVOCs, PCBs, and pesticides were not detected above TOGS 1.1.1 guidance values in the groundwater samples collected from the monitoring wells during the RI. No VOCs were detected above TOGS 1.1.1 guidance values apart from acetone and chloroform concentrations detected slightly above guidance values in one well each. The metals sodium and iron were detected above TOGS 1.1.1 guidance values, both constituents are likely naturally occurring because of bedrock constituents.

6.5 GROUNDWATER TRANSPORT

As previously noted in Section 5.4.2 (Contaminants of Concern – Groundwater), there are no contaminants of concern in groundwater.

Since the Site and surrounding area are serviced by municipal water, which will also be used for the new development, significant exposure to any chemicals in the groundwater are minimal at the Site.

6.6 EXPOSURE PATHWAY SUMMARY

Based on the above assessment, the pathways through which COC could reach receptors at significant exposure concentrations are minimal. The most potentially complete pathways include fugitive dust generation if the existing cover is disturbed and volatilization of VOCs (soil vapor) from impacted subsurface materials.

7.0 QUALITATIVE HUMAN HEALTH EXPOSURE ASSESSMENT

A Qualitative Human Health Exposure Assessment (QHHEA) was completed in general accordance with Appendix 3B of DER-10 to identify potential exposure pathways associated with the COC at the Site. The exposure pathway elements are summarized as follows:

7.1 HUMAN EXPOSURE

Qualitative Exposure Assessment Summary	
Environmental Media & Exposure Route	**Human Exposure Assessment**
Direct contact with surface soils (and incidental ingestion)	(Current) The general population should not come into contact with contaminated surface

	soils as they are primarily covered by hardscape and vegetative cover.
Direct contact with subsurface soils (and incidental ingestion)	(Future) People may come into contact with subsurface soils during ground-intrusive work related to remediation and new development.
Ingestion of groundwater	Although there were minor exceedances found in groundwater, the Site is currently and will continue to be served by municipal water.
Direct contact with groundwater	Although there were minor exceedances found in groundwater, the Site is currently and will continue to be served by municipal water.
Inhalation of air (exposures related to SVI)	(Current) There are currently no occupied buildings on-site, therefore soil vapor intrusion is not a current concern. (Future) People may come into contact with impacted soil vapors during existing cover disturbance. The concentration of soil vapors is low, there is also the potential for inhalation of soil vapors through soil vapor intrusion for any future site redevelopment and occupancy.

7.1.1 CONTAMINATE SOURCES

Analytes exceeding regulatory standards were consistently observed throughout Site soils. Based on the RI and previous investigations, the overburden is almost entirely composed of impacted fill, ranging in depth from 1.5 to 5 feet bgs. No point contaminant sources have been identified, and groundwater has been minimally impacted. In performing a sub-slab vapor (RI-SS-1)/indoor air (RI-IA-1)matrix analysis, no VOC compounds included in the matrices called for mitigation but were all assessed at no further action.

7.1.2 CONTAMINANT RELEASE AND TRANSPORT MECHANISMS

The only release/transport of impacted soils to an exposed population would be through fugitive dust from any disturbace of the existing cover matrerial and rain that may result in soil erosion. However, as previously noted, the Site is currently covered with hardscape and grassed areas with very little exposed soil which limits any fugitive dust generation along with erodible soils. There are no public groundwater wells on the Site effectively eliminating population exposure to groundwater. Impacted soil vapors may be released to the environment if the existing cover is disturbed. Currently Site is vacant and fenced and has a mostly impermeable cover system as previously noted.

7.1.3 POTENTIAL EXPOSURE POINTS

Currently, direct contact exposure to impacted soil is low due to the predominantly hardscape and greenspace cover over the Site. Inhalation of site-related contaminants of concern is currently unlikely, as the site is fenced off and vacant. The fencing extremely reduces accessibility to the general public. There are no public groundwater wells on the Site and groundwater is mostly located at greater than 10 feet bgs.

7.1.4 ROUTES OF EXPOSURE

Current or future route of exposure would be direct contact or inhalation/ingestion of impacted soils. There is also the potential for inhalation of soil vapors through soil vapor intrusion for any future site redevelopment and occupancy. Although no contaminants of concern were identified for groundwater, there were minor exceedances. There is potential for direct contact or ingestion of groundwater during ground intrusive work.

7.1.5 ON-SITE RECEPTOR POPULATION

The receptor population is currently limited to trespassers.

7.1.6 OFF-SITE EXPOSURE

Currently, direct exposure to off-site receptors from Site impacted soil is low due to the predominantly hardscape and grass/greenspace cover over the Site. Although currently limited, off-site migration of contaminants could potentially impact off-site receptor populations during future remediation.

7.2 ECOLOGICAL EXPOSURE RISKS

The property in its current condition is not a habitat to wildlife. Site erosion is minimal as nearly all of the site consists of grassed greenspace and other hardscape. Surface run-off flows off-site to the surrounding street stormwater collection system.

The Fish and Wildlife Resources Impact Analysis (FWRIA) Decision Key provided in Appendix 3C of DER-10 was completed during development of the RIWP and is included in **Appendix J**. No FWRIA is required based on the completed decision key process. This determination is based on the following:

- The Site was commercial property in a Brownfield Opportunity Area (BOA).
- The contamination at the site has very low potential to migrate into or impact any off-site habitat of endangered, threatened, or special concern species or other fish and wildlife resources.
- There are no habitats onsite or nearby.

Any future intrusive work will be conducted in accordance with a Health and Safety Plan (HASP) and a Community Air Monitoring Plan (CAMP). CAMP reports will be generated and submitted to NYSDEC and NYSDOH daily while ground-intrusive activities are ongoing. Exceedances of CAMP action levels and any corrective measures taken will be reported to the Departments within 24 hours of occurrence.

Weather Conditions:	Sunny, High 78°F, 10-15 MPH SW wind

Description of Work Performed:

BE3 and Ramco Excavation arrived on site at approximately 8:00 a.m. to perform the Gamma Radiation Survey Plan. A background area was established along the northern edge of the site. Background radiation readings averaged approximately 6,013 counts per minute (CPM) at the ground surface and ranged from approximately 5,500 CPM at 1.0 ft below ground surface (bgs) to 7,000 CPM at 1.5 ft bgs in the excavator bucket. The team then moved to the area of Test Trench TT-4, where a 4.0-foot-deep trench was excavated. Gamma radiation readings were collected at approximately 0.5-foot intervals during excavation. Readings ranged from 5,200 to 7,500 CPM. Upon completion of the excavation, a walkover was performed around the TT-4 area, with readings averaging approximately 6,200 CPM. Following completion of the survey, all excavated trenches were properly backfilled, graded, and restored.

ILLUSTRATION/COMMENTS:

A test pit gamma survey was performed at 375 Michigan Ave BCP project based upon DEC observing slag like material within and around TT-4.

The background location was chosen off-site to the north where five, 1-minute counts were taken on the surface to establish background. 1-5863 counts per minute (cpm), 2-5941 cpm, 3-6208 cpm, 4-5950 cpm and 5-6104 cpm. They average out to a background of **6,013 cpm.** In-situ gamma background within the trench was obtained with the following five, 1-minute counts: 1-10567 cpm, 2-10105 cpm, 3-10940, 4-11090 cpm and 5-10491 cpm that averaged **10,638 cpm**. Action levels based on background reading are slated as 1.5 times the average; **15,957 cpm**. Exterior bucket background was also obtained and these reading were 1-6076 cpm, 2-7209 cpm, 3-6476 cpm, 4-7354 cpm and 5-7535 cpm for an average of **6,930 cpm**.

After completing the background survey crew transitioned to performing a test trench around Test Trench 4 from the previous site investigation at which potential TENORM was observed on site. The readings during the performance of this test pit were consistent with those seen during the background investigation. Surficial readings were between **5k-8k cpm**. In-situ trench readings were between **9-12k cpm**. And readings in the bucket ranged from **5.5k- 8.5 k cpm**. No readings were above 1.5 times background at any point during the test pitting exercise.

GC/MS VOA
Method 8260D: The laboratory control sample (LCS) for preparation batch 480-779855 and analytical batch 480-779859 recovered outside control limits for the following analyte: Chloromethane. This analyte is biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported. The associated samples are: RI-MW-1 (480-240008-1), RI-MW-2 (480-240008-2), RI-MW-3 (480-240008-3) and RI-MW-4 (480-240008-4)

Method 8260D: The continuing calibration verification (CCV) associated with batch 480-779859 recovered above the upper control limit for 1,1,1-Trichloroethane, 1,1,2-Trichloro-1,2,2-trifluoroethane, 1,1-Dichloroethene, 2-Butanone (MEK), Carbon disulfide, Carbon tetrachloride, Chloromethane, cis-1,3-Dichloropropene, Cyclohexane, Dichlorodifluoromethane, Methylcyclohexane, Trichloroethene, Trichlorofluoromethane and Vinyl chloride. The samples associated with this CCV were non-detects above the reporting limits for the affected analytes; therefore, the data have been reported. The associated samples are:RI-MW-1 (480-240008-1), RI-MW-2 (480-240008-2), RI-MW-3 (480-240008-3) and RI-MW-4 (480-240008-4).

Method 8260D: The continuing calibration verification (CCV) associated with batch 480-779859 recovered outside acceptance criteria, low biased, for 1,2,4-Trichlorobenzene. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported. The associated samples are:RI-MW-1 (480-240008-1), RI-MW-2 (480-240008-2), RI-MW-3 (480-240008-3) and RI-MW-4 (480-240008-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 480-779734 recovered above the upper control limit for 2,4-Dinitrophenol and 4,6-Dinitro-2-methylphenol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are:RI-MW-1 (480-240008-1), RI-MW-2 (480-240008-2), RI-MW-3 (480-240008-3) and RI-MW-4 (480-240008-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 6010D: The linear range check (LRC) standard recovery associated with 480-779918 is outside the acceptance criteria for the following analytes: Silver. The concentration of these analyte(s) in the sample(s) are below the highest standard of the calibration curve; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

LCMS
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method 9012B: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 480-779852 and analytical batch 480-779868 was outside control limits. Sample matrix interference is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC/MS VOA
Method 8260D: The laboratory control sample (LCS) for preparation batch 480-779978 and analytical batch 480-779982 recovered outside control limits for the following analytes: 2-Butanone (MEK), Acetone and Chloromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The associated samples are: RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18)

Method 8260D: The continuing calibration verification (CCV) associated with batch 480-779982 recovered above the upper control limit for 1,1,1-Trichloroethane, 1,1,2-Trichloro-1,2,2-trifluoroethane, 1,1-Dichloroethane, 1,1-Dichloroethene, 1,2-Dichloropropane, 2-Butanone (MEK), Benzene, Carbon disulfide, Carbon tetrachloride, Chloromethane, Cyclohexane, cis-1,3-Dichloropropene, Bromodichloromethane, Dichlorodifluoromethane, Methylcyclohexane, Methylene Chloride, trans-1,2-Dichloroethene, Trichloroethene, Trichlorofluoromethane and Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are:RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 480-780139 recovered outside acceptance criteria, low biased, for Hexachlorocyclopentadiene. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported. The associated samples are:RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18).

Method 8270E: The continuing calibration verification (CCV) associated with batch 480-780139 recovered above the upper control limit for 2,4-Dinitrophenol, 2,4-Dinitrotoluene, 4,6-Dinitro-2-methylphenol, 4-Nitroaniline, 4-Nitrophenol and Atrazine. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are:RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18).

Method 8270E: The following samples were diluted due to color, appearance, and viscosity: RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18). Elevated reporting limits (RL) are provided.

Method 8270E: The following samples required a dilution due to the nature of the sample matrix: RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8081B: The following samples were diluted due to the nature of the sample matrix: RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18). As such, surrogate recoveries are below the calibration range, estimated and not representative. Elevated reporting limits (RLs) are provided.

Method 8081B: The following samples were diluted due to the nature of the sample matrix: (480-240098-C-11-A MS) and (480-240098-C-11-B MSD). As such, spike and surrogate recoveries are below the calibration range, estimated and not

representative. Elevated reporting limits (RLs) are provided.

Method 8082A: For method 8082, the recovery of the one surrogate in samples RI-BH-1 0-2 (480-240098-15) exceeds quality control limits. The recovery of the secondary surrogate is within quality control criteria; no corrective action is required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010D: The continuing calibration blank (CCB) for analytical batch 480-780074 contained Manganese above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method 6010D: The linear range check (LRC) standard recovery associated with 480-780074 is outside the acceptance criteria for the following analytes: Silver, Arsenic, Cadmium, Cobalt, Copper, Potassium, Antimony, Selenium, Thallium. The concentration of these analyte(s) in the sample(s) are below the highest standard of the calibration curve; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

LCMS
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3546: The following samples required a Florisil clean-up, via EPA Method 3620C, to reduce matrix interferences: RI-BH-3 0-2 (480-240098-10), RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-1 0-2 (480-240098-15), RI-BH-2 0-2 (480-240098-16), RI-BH-8 0-2 (480-240098-17), RI-BH-12 0-2 (480-240098-18), (480-240098-C-11 MS) and (480-240098-C-11 MSD).

Method 3546: Due to the matrix, the initial volume(s) used for the following samples deviated from the standard procedure: RI-BH-4 0-2 (480-240098-11), RI-BH-9 0-2 (480-240098-12), RI-BH-10 0-2 (480-240098-13), RI-BH-11 0-2 (480-240098-14), RI-BH-8 0-2 (480-240098-17) and RI-BH-12 0-2 (480-240098-18). The reporting limits (RLs) have been adjusted proportionately.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
