SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 09/19/2023 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes

available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 09/19/2023 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 07/24/2023 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or

dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 3 RCRA-VSQG sites within approximately 0.25 miles of the target property.

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 08/07/2023 has revealed that there are 3 NY SHWS sites within approximately 1 mile of the target property.

NY ERP: In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 22 EDR Hist Auto sites within approximately 0.125 miles of the target property.

DEC Memo:	"Trench T-2 was advanced in the west-middle of the 138 Monroe Street property from west to east. The trench was about 5-6 feet off the west property line; 34 feet from the north property line and 26 feet from the assumed south property line. At completion, Trench T-2 was 26 feet long by 6-9 feet deep by 4 feet wide. The soil was described as follows: 2-3 feet of sandy, clayey silt fill material across most of the trench except in the middle-east section which had fill down to 9 feet. The fill contained pieces of wood, concrete, and brick except for in the deep section which also included pieces of tile, wood, netting, a plastic mop tub on wheel, and other miscellaneous materials. The soil and materials in this area were black and a slight sewer or wet organic odor was observed. A reading of 5.0-8.5 ppm was observed on the PID over this material. No odors or elevated PID reading were observed across the remainder of the trench.

NORSTAR DEVELOPMENT (Continued) **S127290925**

This area appeared to be limited to about a 5-10-foot length of the trench. Native red-brown clay was observed below the fill layer to the bottom of the trench in all but this 5-foot area which extended down to at least 9 feet. Perched water was also observed in this location. A soil sample was collected from the black material/soil and submitted to Paradigm Laboratory for NYSDEC CP-51 volatile organic and PCB analysis see Section 3.2. CP-51 Soil Cleanup Guidance provides the framework and procedures for the selection of soil cleanup levels appropriate for various remedial programs in the New York State Department of Environmental Conservation (DEC) Division of Environmental Remediation (DER) including the Spill Response Program - Navigation Law (NL) section The results did not indicate the presence of VOCs above CP-51 levels. A few petroleum based compounds were detected well below CP-51 clean-up objectives Field observations and screening as well as the laboratory results did not indicate any significant or widespread soil impacts associated with this former use. The assessment did confirm that C&D materials do exist in the subsurface at relatively shallow depths at most locations and that low levels below DEC soil cleanup guidance of organic materials were found in one isolated small area of the property.. No action by spills is necessary. The site is closed."

Remarks: "BE3 excavated 6 trenches at a former transmission repair location. Trench T2 had PID levels at 5 to 8.5 ppm. No physical evidence of petroleum was found. A soil sample was collected. Low levels of 5 petroleum related compounds were identified in the result, far below the CP51 levels."

Environmental Interest/Information System:

The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.

Site Description:	The facility began operations as Buffalo Forge in 1877. Buffalo Forge onginally manufacrured small forges and then ceased those activities circa 1900 and evolved into an industrial fan manufacturing plant. From about 1878 until 1986 the facility also operated a foundry in which brass, iron, and aluminum were cast. The final built-out facilil)' footprint totaled approximately 300,600 square feet and contained approximately 550,000 square feel of built-out space. The facility was comprised of multiple buildings that were joined together structurally. and included offices, a foundry, a boiler room, manufacturing and machining areas, storage areas, and a power distribution room referred to as the "capacitor room." A

small maintenance garage was located on the east side of Mortimer Street. The facility was closed in the late 1990s. Most of the manufacturing equipment and materials were removed upon closure and the facilily remained closed and locked thereafter. By 2000 the deteriorating building conditions and presence of asbestos-containing materials inside the buildings gained increased attention from the City of Buffalo, the New York State Department of Labor (NYSDOL) and the federal Occupational Safety and Health Administration. Howden (owner) elected to pursue the complete demolition of the facility in 2005. A report (2007) documented the decommissioning, demolition, and remedial work conducted at the former Buffalo Forge facility located at 490 Broadway Street, Buffalo, New York from September 2005 through May 2007. Part of the work included a self-implementing cleanup of polychlorinated biphenyls (PCBs) contained in Site media, in accordance with federal regulations under the Toxic Substances Control Act. The PCB Cleanup Plan was approved by USEPA. No hazardous wastes are present at the site based on the final report.

Env Problem: No hazardous waste remains and the site does not pose a significant threat to the environment.

Health Problem: Not reported

Site Description:	Location: The Former Buffalo Forge Property site is an approximately 12.426-acre site, located in an urban area, at 490 Broadway Street in the City of Buffalo, Erie County. The site is comprised of seven non-contiguous, adjacent parcels, located at 490 and 498 Broadway, 187, 213 and 233 Mortimer Street, and 498 and 516 Spring Street. Site Features: The site is relatively flat with grassy vegetation, asphalt parking areas, and apartment buildings. Current Zoning and Land Use: The site is zoned for commercial and industrial uses and is redeveloped into green space, parking areas, and apartments. The surrounding parcels are used for a combination of residential, commercial, light industrial, and utility rights-of-way. The site is adjacent to residential properties. Past Use of the Site: The site was used for manufacturing and foundry operations until the early 1990s. Prior uses that appear to have led to site contamination include a machine shop, blacksmith/foundry, and numerous underground storage tanks (USTs). Prior to demolition of site buildings in

BUFFALO FORGE CO PLANT #1 (Continued) **1000227730**

	2006-2007, all identified USTs were removed and contaminated soil encountered in the tank excavations was removed and disposed off-site. Site Geology and Hydrogeology: The site is generally overlain by 1 foot of miscellaneous cover material which includes soil, blacktop and foundations. This fill is underlain by up to 1.7 feet of fill/foundry sand, followed by 3 feet of fill (silt, sand, gravel, brick, and wood), and 4.5 feet of native clay/silt. Depth to bedrock is approximately 2-11.5 feet below ground surface (fbgs). The depth of groundwater is approximately 6-9 fbgs and flows southeast.
Env Problem:	Remediation at the site is complete. Prior to remediation the primary contaminants of concern were grossly contaminated material (GCM) impacted with petroleum, metals, including arsenic, lead and mercury, polycyclic aromatic hydrocarbons(PAHs), and PCBs in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use on all parcels except 498 Broadway, where remedial actions achieved commercial use soil cleanup objectives. Residual contamination in the soil and groundwater is being managed under a Site Management Plan.
Health Problem:	Measures are in place to address potential contact with residual site contaminants.

Site Description:	Location: The 500 Seneca Street Site is an approximately 1.874-acre site, located in an urban area, at 500 Seneca Street in the City of Buffalo, Erie County. The site encompasses an entire block bordered by Seneca Street to the south, Myrtle Street to the north, Hamburg Street to the east, and Spring Street to the west. Site Features: There is a 328,000-square-foot, multi-story building on most of the site with a small open lot on the western side of the parcel. The building was constructed in 1901 and there have been numerous additions. An open-air courtyard exists in the eastern portion of the building. Current Zoning and Land Use: The site building has been refurbished and is currently occupied by several commercial tenants, including restaurants, retail, and apartments. The site is zoned M-1, light industrial district. The building is listed in the National Registry of Historic Places. The nearest residential parcel is less than 500 feet to the north. Past Use of the Site: The F.N. Burt Company used the property for box manufacturing from 1901 until 1959. Between approximately 1968 and 1980 the site was occupied by a clothing rental company. Between 1986 and 2004, the site was used for manufacturing, warehousing, and shipping operations. The site was mostly vacant and underutilized after manufacturing operations ceased in 2004. Two underground storage tanks were removed from the open lot area in December 2007 (spill number 0751217). In addition to the tanks, approximately 45 tons of petroleum contaminated soil and 1,650

	gallons of petroleum/water mixture was removed and disposed. Inaccessible petroleum impacted soil remained under a single-story garage. The remaining impacts resulted in a closed-inactive status for the petroleum spill. Site Geology and Hydrology: The majority of the site is characterized by 6 inches of asphalt or concrete above 6 inches of gravel, with underlying fill soils comprised mostly of sand and brick from 4 to 4.5 feet below ground surface (fbgs). Native soils are encountered about 4.5 fbgs and generally consist of clayey silt with intermittent layers of silty sand and gravel. Bedrock consisting of Middle Devonian, Onondaga Shale was encountered about 13 fbgs. Groundwater is encountered from 5 to 9 fbgs. However, when excavated to bedrock, little infiltration was noted, indicative of a perched condition. The site is located approximately 0.8 miles northeast of the Buffalo River and local site groundwater flows west-northwest with the upper horizon influenced by urban infrastructure.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were arsenic, semi-volatile organic compounds (SVOCs) from residual petroleum products, and trichloroethene in soil. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem:	Measures are in place to prevent contact with remaining site contaminants.

Site Description: Location: The 500 Seneca Street Site is an approximately 1.874-acre site, located in an urban area, at 500 Seneca Street in the City of Buffalo, Erie County. The site encompasses an entire block bordered by Seneca Street to the south, Myrtle Street to the north, Hamburg Street to the east, and Spring Street to the west. Site Features: There is a 328,000-square-foot, multi-story building on most of the site with a small open lot on the western side of the parcel. The building was constructed in 1901 and there have been numerous additions. An open-air courtyard exists in the eastern portion of the building. Current Zoning and Land Use: The site building has been refurbished and is currently occupied by several commercial tenants, including restaurants, retail, and apartments. The site is zoned M-1, light industrial district. The building is listed in the National

Registry of Historic Places. The nearest residential parcel is less than 500 feet to the north. Past Use of the Site: The F.N. Burt Company used the property for box manufacturing from 1901 until 1959. Between approximately 1968 and 1980 the site was occupied by a clothing rental company. Between 1986 and 2004, the site was used for manufacturing, warehousing, and shipping operations. The site was mostly vacant and underutilized after manufacturing operations ceased in 2004. Two underground storage tanks were removed from the open lot area in December 2007 (spill number 0751217). In addition to the tanks, approximately 45 tons of petroleum contaminated soil and 1,650 gallons of petroleum/water mixture was removed and disposed. Inaccessible petroleum impacted soil remained under a single-story garage. The remaining impacts resulted in a closed-inactive status for the petroleum spill. Site Geology and Hydrology: The majority of the site is characterized by 6 inches of asphalt or concrete above 6 inches of gravel, with underlying fill soils comprised mostly of sand and brick from 4 to 4.5 feet below ground surface (fbgs). Native soils are encountered about 4.5 fbgs and generally consist of clayey silt with intermittent layers of silty sand and gravel. Bedrock consisting of Middle Devonian, Onondaga Shale was encountered about 13 fbgs. Groundwater is encountered from 5 to 9 fbgs. However, when excavated to bedrock, little infiltration was noted, indicative of a perched condition. The site is located approximately 0.8 miles northeast of the Buffalo River and local site groundwater flows west-northwest with the upper horizon influenced by urban infrastructure.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were arsenic, semi-volatile organic compounds (SVOCs) from residual petroleum products, and trichloroethene in soil. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem: Measures are in place to prevent contact with remaining site contaminants.

Site Description: Location: The 500 Seneca Street Site is an approximately 1.874-acre site, located in an urban area, at 500 Seneca Street in the City of Buffalo, Erie County. The site encompasses an entire block bordered by Seneca Street to the south, Myrtle Street to the north, Hamburg Street to the east, and Spring Street to the west. Site Features: There is a 328,000-square-foot, multi-story building on most of the site with a small open lot on the western side of the parcel. The building was constructed in 1901 and there have been numerous additions. An open-air courtyard exists in the eastern portion of the building. Current Zoning and Land Use: The site building has been refurbished and is currently occupied by several commercial tenants, including restaurants, retail, and apartments. The site is zoned M-1, light industrial district. The building is listed in the National Registry of Historic Places. The nearest residential parcel is less than 500 feet to the north. Past Use of the Site: The F.N. Burt Company used the property for box manufacturing from 1901 until 1959. Between approximately 1968 and 1980 the site was occupied by a clothing rental company. Between 1986 and 2004, the site was used for manufacturing, warehousing, and shipping operations. The site was mostly vacant and underutilized after manufacturing operations ceased in 2004. Two underground storage tanks were removed from the open lot area in December 2007 (spill number 0751217). In addition to the tanks, approximately 45 tons of petroleum contaminated soil and 1,650 gallons of petroleum/water mixture was removed and disposed. Inaccessible petroleum impacted soil remained under a single-story garage. The remaining impacts resulted in a closed-inactive status for the petroleum spill. Site Geology and Hydrology: The majority of the site is characterized by 6 inches of asphalt or concrete above 6 inches of gravel, with underlying fill soils comprised mostly of sand and brick from 4 to 4.5 feet below ground surface (fbgs). Native soils are encountered about 4.5 fbgs and generally consist of clayey silt with intermittent layers of silty sand and gravel. Bedrock consisting of Middle Devonian, Onondaga Shale was encountered about 13 fbgs. Groundwater is encountered from 5 to 9 fbgs. However, when excavated to bedrock, little infiltration was noted, indicative of a perched condition. The site is located approximately 0.8 miles northeast of the Buffalo River and local site groundwater flows west-northwest with the upper horizon influenced by urban infrastructure.

NEW ERA CAP CO (Continued) **S108982783**

Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were arsenic, semi-volatile organic compounds (SVOCs) from residual petroleum products, and trichloroethene in soil. Remedial actions have successfully achieved soil cleanup objectives for restricted residential use. Residual contamination in the soil is being managed under a Site Management Plan.
Health Problem:	Measures are in place to prevent contact with remaining site contaminants.

Site Description:	Location: The 592 Seneca Street site is an approximately 2.240-acre site located in a highly developed commercial and residential area on the southeast corner of Jefferson Avenue and Swan Street in the City of Buffalo, Erie County. Multiple neighboring former commercial buildings have recently been redeveloped for mixed use commercial and residential occupancy. The site is bordered by Jefferson Avenue to the west, Swan Street to the north, an active rail line to the east and vacant land, rail and the elevated Seneca Street overpass to the south. Site Features: The site is currently vacant land. Current Zoning and Land Use: The current zoning for the site is defined as C-R (Rail corridor) and neighbored by Transition to Urban Core (N-1), which allows for mixed use development.The Applicant is in the process of reviewing if a zoning variance will be necessary, but based on recent conversions of former commercial buildings to residential use across Jefferson Street, the planned development is consistent with the development patterns for this section of the City of Buffalo. The surrounding parcel uses are as follows: to the north, commercial, residential and vacant; to the south, vacant and railroad; to the east, rail line with commercial/residential; and to the west, mixed use commercial and residential. Past Use of the Site: Based on historic records and previous investigations, the site was identified as having a history as railroad tracks/yards from at least the 1890s to the 1980s. Historic operations and buildings associated with the railroad tracks/yards include ice storage, coal, and coke storage. Railroad areas were previously built-up with fill materials from unknown sources, with railroad ties remaining on-site. Due to the site s industrial history, previous investigations have identified PAHs and metals at concentrations exceeding RRSCOs, CSCOs, and ISCOs. Redevelopment of the site for restricted residential use will require remediation to a Track 4 RRSCO prior to site development. Site Geology and Hydrogeology: The site is located within the Erie-Ontario Lowlands, which is typified by little topographic relief, and gently slopes westward towards Lake Erie, except in the immediate vicinity of major drainage ways. The surficial geology of the Erie-Ontario Lowlands has developed from lacustrine deposits or till that may contain both limestone and shale. According to the United States Department of Agriculture

592 SENECA STREET SITE (Continued) **S127478149**

	(USDA) Web soil survey, site soils are characterized as Urban land (Ud) Urban land is characterized where 80 percent or more of the soil surface is covered by asphalt, concrete, buildings, or other impervious structures, typical of an urban environment. The site overlies the Skaneateles Formation, which is identified as Middle Devonian-aged medium/dark gray fossiliferous shale and mudrock. Previous investigations have identified fill material on-site ranging from approximately 0-8 fbgs, generally described as consisting of ash, cinders, black sands, brick, coal, concrete, and wood debris, underlain by assumed native (potentially reworked) sandy lean clay to at least 13 fbgs. Bedrock was not encountered during previous investigations. Regional and local groundwater likely flow south towards the Buffalo River and west towards Lake Erie. Local groundwater flow, however, may be influenced by subsurface features, such as utilities, former development, and localized subsurface fill conditions. Additional work is required to investigate groundwater flow direction and quality at the site.
Env Problem:	Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available.

Operable Units: The site has been subdivided into three Operable Units (OUs) described as follows: OU1 - Former Lagoon Area: This operable unit consists of contaminated soil and groundwater in the former settling lagoon area; OU2 - Area North of the Former Wastewater Treatment Plant: This operable unit consists of contaminated soil and groundwater in the area north of the former wastewater treatment plant; and OU3 - Eastern Area: This operable unit consists of contaminated soil and groundwater in the eastern portion of the site along Wales Avenue. Historical Use: In 1959 Chemical Leaman Tank Lines (Chemical Leaman) purchased the property. Chemical Leaman was a common carrier transporting bulk chemicals by

CHEMICAL LEAMAN TANK LINES (Continued) **S118950605**

tank truck. By 1963 Chemical Leaman had constructed several buildings and made other improvements at the facility, and began operating the site as a tank truck terminal. Chemical Leaman s operations at the facility included tank truck dispatching, maintenance and cleaning. Chemical Leaman s operations at the facility continued until 2001, when the truck dispatching, maintenance and cleaning activities ceased, and the onsite wastewater treatment facility was decommissioned. Historically, tank washings passed through three lagoons (OU1) where solids settled to the bottom. Discharge from the ponds went to the Tonawanda Sewage Treatment Plant. The use of the lagoons for toxic materials was discontinued in 1978. During the summer and fall of 1988, Chemical Leaman excavated the three lagoons to a depth of 14 to 16 feet. Approximately 4,000 cubic yards of stabilized sludge and underlying soil were sent offsite for disposal. Substrate samples were collected and analyzed as the excavations progressed. Six monitoring wells at the site were subsequently sampled and analyzed to evaluate the effectiveness of the excavation/removal activities. The results found several VOCs at concentrations above the applicable groundwater standards, and also identified another on-site source close to the tank truck washing facility (OU3). A Record of Decision (ROD) issued in March 2006 requires: OU1 - Injection of a chemical oxidant and long term monitoring; OU2 - Excavation and off-site disposal of soil with long term monitoring; OU3 - Excavation and off-site disposal of soil with long term monitoring. The entire site will require a Environmental Easement with periodic certification. An RD/RA consent order was executed on April 9, 2008. Field work began in mid October 2009. The Remedial Design was approved in December 2012. Remedial Action was completed in the early summer 2015. A Site Management Plan (SMP) and Final Engineering Report (FER) have been submitted and reviewed and found that revisions were required. In addition, soil vapor intrusion investigations that were required by the ROD were not completed. These investigations have been completed but the report has not been submitted to the Departments for review. Site Geology/Hydrology: There are three distinct geologic units that were encountered at the site. The uppermost soil unit consists of fill made up primarily of crushed stone, gravel, silty sand and clay, brick fragments, coal, concrete pieces and slag. The thickness of this unit generally ranges from 2 to 4 feet, but is much greater in the former settling lagoons, ranging from 10 to 13 feet; Alluvial sediments consisting primarily of brown to dark gray, fine-grained, sand containing some silt and clay. In the northern portion of the site this unit extends to a depth of 28 feet below ground surface (bgs). It becomes shallower across the site in a southerly direction, extending to depths of 21 to 24 feet bgs in the Former Lagoon Area, and 16 to 18 feet bgs in the southern portion of the site near Ellicott Creek; Glaciolacustrine sediments consisting primarily of reddish brown silty clay. This unit has a very low permeability (meaning that groundwater cannot easily move through it). Although this deposit was not fully penetrated during the RI, previous investigations at the site indicate that this unit is approximately 14 feet thick. During the RI, this deposit was encountered at depth ranging from 16.0 to 28.0 feet bgs. Bedrock was not encountered at the site during the RI or any of the previous investigations, but is thought to be the Camillus Shale Formation of the Salina Group. Groundwater underlying the Site is encountered primarily within the alluvial sand deposit. During most of the year (summer, fall and winter months), groundwater

	flow within this deposit is southerly across the site toward Ellicott Creek (Figure 3). During the spring months, however, this flow pattern in altered by a groundwater mound that occurs. Although the location of this mound varies somewhat during this period, it is generally centered in the vicinity of the former lagoons. The low permeability of the glaciolacustrine silty clay prevents the downward movement of contaminated groundwater into deeper water bearing zones (e.g., the Camillus Shale Formation).
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern (COC) at OU1 were benzene, chlorobenzene, tetrachloroethene, toluene, trichlorobenzene, trichloroethene, chromium and zinc in subsurface soil; and benzene, chlorobenzene, vinyl chloride, methylphenol, DDT, antimony and lead in groundwater. Prior to remediation, the primary COC at OU2 were dichloroethene, trichloroethene, chromium and zinc in subsurface soil; and benzene, chlorobenzene, methylphenol, phenol, DDT, antimony and lead in groundwater. Prior to remediation, the primary COC at OU2 were chlorobenzene, dichlorobenzene, trichlorobenzene, chromium and zinc in subsurface soil; and benzene, chlorobenzene, dichlorobenzene, dichloroethene, ethylbenzene, trichlorobenzene, trichloroethene, vinyl chloride, methylphenol, phenol and lead in groundwater. Residual contamination will be managed under a Site Management Plan, which has not yet been approved.
Health Problem:	All area residents are supplied with public water so exposures to contaminated groundwater are not expected. Soil samples have been collected on-site, and sample results indicate no surface soil comtamination. However, subsurface contamination is present in the former lagoon areas and in several areas of the parking lot. Most of the site is fenced to restrict public access. A portion of the site is unfenced, although it is not readily accessible.

Site Description: Mollenberg-Betz used this site to steam clean commercial refrigeration equipment. The washings, consisting of oil, grease and dirt, were permitted to flow directly into the ground. Waste oil was also spread on a parking lot for dust control. The company abandoned the steam cleaning operation in 1978. Erie County prepared a site profile report in 1982. A Phase I Investigation has been completed. Soil sampling taken by NYSDEC in 1989 did not find contaminants at levels of concern. The disposal of hazardous waste can not be documented at this site.
Env Problem: No environmental problems have been noted at this site.
Health Problem: The site is located in a mixed residential and industrial area along Scott Street in South Buffalo. Washings from a steam cleaning operation were formerly disposed of by direct discharge to the ground outside of the plant building. Waste oils were also spread over a gravel parking lot for dust control. This area is now paved with asphalt. No environmental monitoring data is available for this site. It is likely that any contamination which may exist in the soils is directly under the disposal area. Contamination of the underlying groundwater is possible. No wells in the area are used for drinking

Environmental Interest/Information System:
The Integrated Compliance Information System (ICIS) provides a database that, when complete, will contain integrated enforcement and compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained in ICIS by EPA in the Regional offices and it at Headquarters. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to

BERN METALS - USEPA ERRD (Continued) **1000447082**

track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
THE SUPERFUND ENTERPRISE MANAGEMENT SYSTEM (SEMS) INTEGRATES MULTIPLE LEGACY SYSTEMS INTO A COMPREHENSIVE TRACKING AND REPORTING TOOL, PROVIDING DATA ON THE INVENTORY OF ACTIVE AND ARCHIVED HAZARDOUS WASTE SITES EVALUATED BY THE SUPERFUND PROGRAM. IT CONTAINS SITES THAT ARE EITHER PROPOSED TO BE OR ARE ON THE NATIONAL PRIORITIES LIST (NPL) AS WELL AS SITES THAT ARE IN THE SCREENING AND ASSESSMENT PHASE FOR POSSIBLE INCLUSION ON THE NPL.

BERN METALS (Continued) **1000305569**

site located in an urban area at 22 Bender Street in the City of Buffalo, Erie County. Site Features: The site consists of a large, capped landfill surrounded by chain link fence. The site is bordered by a railroad track to the southwest and by residential and commercial properties to the north and east. Past Use of the Site: The site was previously used for scrap reprocessing. A Phase I Investigation completed in 1987 identified approximately two hundred 55-gallon drums, metal turnings, waste chemicals, sludges, battery cases and spilled battery acids on the site. About 25 leaking transformers containing PCBs were found on the neighboring property. In 1990, USEPA conducted an emergency removal at the site. Drums, gas cylinders and transformers were removed during this action. Under order by USEPA, a group of potentially responsible parties (PRPs) remediated neighboring residential properties and erected a fence around the contaminated site in 1994.

Env Problem:	Remediation at the site is complete. Remedial actions have successfully achieved soil cleanup objectives for a closed landfill. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem:	This site is located in a mixed industrial/residential area in the City of Buffalo that is served by public water. There are no known private wells in the immediate area. Therefore, human exposures to site-related contaminants via drinking water are not expected. Elevated levels of lead, up to 176,000 milligrams per kilogram, were present on-site in subsurface soils. These soils have been consolidated and capped on the site. NYSDOH coordinated blood lead testing of nearby residents in 1991 and no elevated blood lead levels attributable to the site were found. The USEPA replaced nearby residential yard soils with clean soil in 1992 and 1993. Along with the consolidation and capping of site soils, institutional controls and fencing are in place to protect public health.

Past Use of the Site: The site was previously used for scrap reprocessing. A Phase I Investigation completed in 1987 identified approximately two hundred 55-gallon drums, metal turnings, waste chemicals, sludges, battery cases and spilled battery acids on the site. About 25 leaking transformers containing PCBs were found on the neighboring property. In 1990, USEPA conducted an emergency removal at the site. Drums, gas cylinders and transformers were removed during this action. Under order by USEPA, a group of potentially responsible parties (PRPs) remediated neighboring residential properties and erected a fence around the contaminated site in 1994.
Env Problem: Remediation at the site is complete. Remedial actions have successfully achieved soil cleanup objectives for a closed landfill. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem: This site is located in a mixed industrial/residential area in the City of Buffalo that is served by public water. There are no known private wells in the immediate area. Therefore, human exposures to site-related contaminants via drinking water are not expected. Elevated levels of lead, up to 176,000 milligrams per kilogram, were present on-site in subsurface soils. These soils have been consolidated and capped on the site. NYSDOH coordinated blood lead testing of nearby residents in 1991 and no elevated blood lead levels attributable to the site were found. The USEPA replaced nearby residential yard soils with clean soil in 1992 and 1993. Along with the consolidation and capping of site soils, institutional controls

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

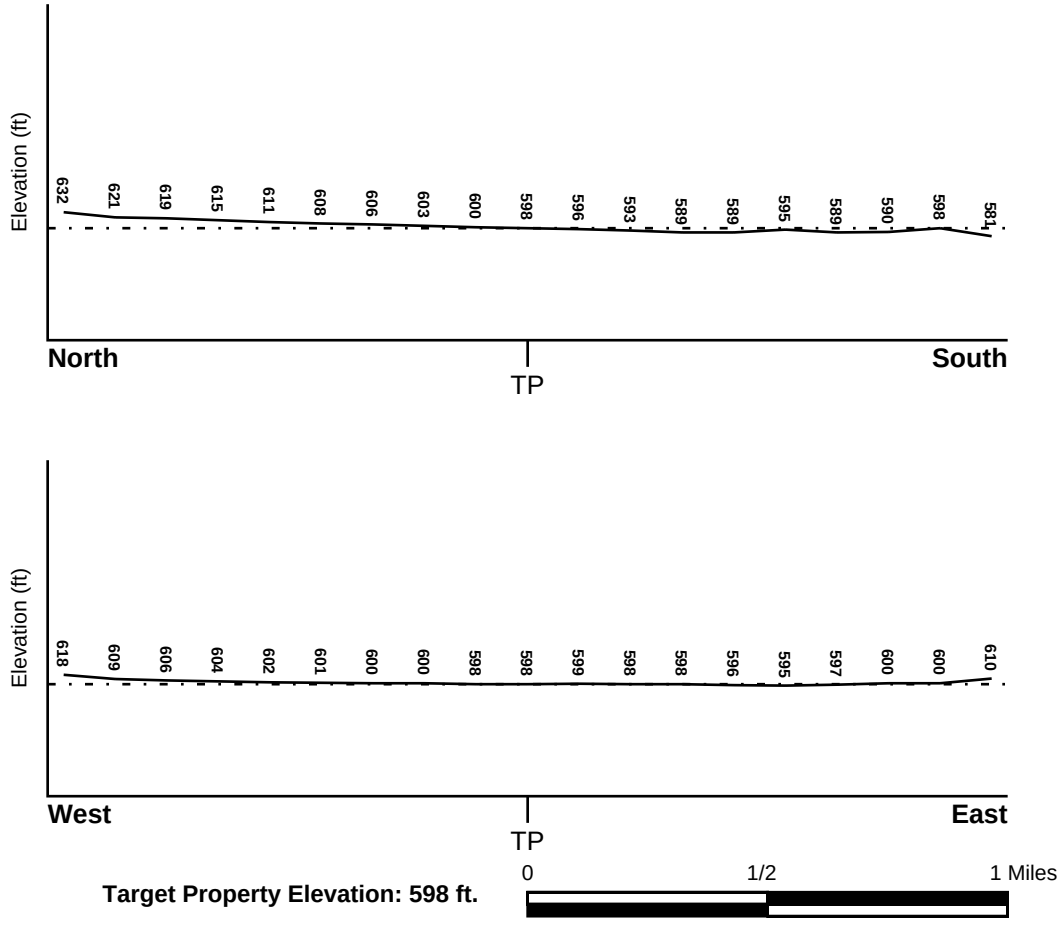
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

ENVIRONMENTAL ENGINEERING AND REMEDIATION

Mr. Burke is a geologist/environmental scientist whose practice involves site investigation and remediation, transactional due diligence, environmental site assessments, in-situ remedial technology, and manufactured gas plant (MGP) site characterization and remediation, multi-media compliance audits, sub-slab depressurization system design, non-hazardous and hazardous waste management, emergency response, community air monitoring programs, environmental and geotechnical site investigations, and health and safety monitoring. He has experience with projects in the New York State Department of Environmental Conservation (NYSDEC) and New York State Brownfield Cleanup (NYS BCP) Programs; Inactive Hazardous Waste, and Spill Programs, and New York City Office of Environmental Remediation (OER) e-designated and New York City Voluntary Cleanup Program (NYC VCP) sites.

SELECTED PROJECTS

1607 Surf Avenue, Brooklyn, NY - Mr. Burke was the Principal-in-Charge of this New York State Brownfield Cleanup Program site. The site was historically used as an automobile repair facility, machine shops, manufacturing and for automobile parking. The site was remediated to unrestricted use. The scope of the remedy included design of a support of excavation and dewatering system required to excavate 26,000 tons of contaminated soil, including RCRA hazardous waste, post-excavation groundwater monitoring and performance of a post-construction soil vapor intrusion study to confirm that active soil vapor mitigation is not required. Remediation was complete in 2022. The site is currently used for 100% affordable multi-family residential housing.

475 Bay Street, Staten Island, NY - Mr. Burke was the Principal-in-Charge of this New York State Brownfield Cleanup Program site. The site was historically used for commercial and industrial entities, including coal and lumber yards, gasoline filling stations, an automobile painting shop and repair facility, and manufacturing. The scope of the remedy included removal and decommissioning of petroleum bulk storage tanks, design and installation of a support of excavation and dewatering system to facilitate contaminated soil excavation and performance of a post-construction soil vapor intrusion investigation to determine if active soil vapor intrusion mitigation is warranted. The site was remediated to allow for restricted residential use. Remediation was complete in 2022. The site is currently used for multifamily residential use, including affordable housing.

1525 Bedford Avenue, Brooklyn, NY – Mr. Burke was the Principal-in-Charge of this New York State Brownfield Cleanup Program site. The site was historically used as a gasoline filling station and car washing facility. Historical releases of gasoline impacted soil, soil vapor and groundwater. Because the site is situated within the terminal moraine in Brooklyn, groundwater is around 60 feet below grade and in-situ treatment was necessary following source removal. The remedy included removal of

primary contaminant sources by decommissioning petroleum bulk storage tanks. Vapor mitigation was accomplished through installation of a vapor barrier beneath composite cover system and installation of a sub-membrane depressurization system beneath cellar areas that are not occupied by a ventilated parking garage. Residual petroleum-impacted soil beyond the depth of excavation was treated in-situ with a soil vapor extraction system. Remediation was complete and Certificate of Completion was issued by the NYSDEC in 2017.
