Former AFMC Site, Sackets Harbor, NY
ERP Site Number E623014
SAC Number C303893
SE File: 09-761

Dear Mr. Jesmore:

Attached for your review are two (2) copies of the revised Interim Remedial Measures (IRM) Work Plan for soil excavation on the South Terminal parcel of the Former AFMC ERP site in Sackets Harbor. This Work Plan has been revised in response to comments from the NYSDOH.

Thank you very much for your assistance, if you have any questions of comments, please contact the undersigned.

Sincerely,
STRATEGIC ENVIRONMENTAL, LLC

Thomas R. Byrnes, P.G.
Senior Project Manager

CC: Hon. Eric Constance, Mayor, Village of Sackets Harbor

WORK PLAN
INTERIM REMEDIAL MEASURES
FORMER AFMC, INC. PETROLEUM BULK STORAGE FACILITY
SOUTH TERMINAL
ERP Site Number E623014

1.0 INTRODUCTION

The Former AFMC Bulk Petroleum Storage Terminals ERP Site (Site No. E623014) is located in the Village of Sackets Harbor, New York (Figure 1). The site consists of two separate parcels: one north of Ambrose Street (the North Terminal), and one south of Ambrose Street (the South Terminal). A Remedial Investigation (RI) of both parcels has recently been completed by Strategic Environmental, LLC (SE) and a RI/AA Report is being prepared. The RI identified a limited area on the South Terminal parcel with petroleum contamination in soil above NYSDEC Residential Use Soil Cleanup Objectives (SCOs). The purpose of this Work Plan is to propose completion of an Interim Remedial Measure (IRM) to excavate soils exceeding Residential Use SCOs on the South Terminal and dispose of these soils at an approved off-site disposal facility. A previous IRM was completed on the North Terminal in November 2009 which was successful in removing soils exceeding Unrestricted Use SCOs on the North terminal. Therefore, completion of this second IRM will constitute the Final Remedy for this site.

1.1 Site Description

The subject property is located to the northwest of the Village of Sackets Harbor, on the southern shore of Lake Ontario, and is a portion of a larger property of approximately 113 acres in land area that had historically served as a petroleum bulk storage and distribution facility under several ownerships. The larger parent property from which the subject property has been delineated consists of two (2) separate tax parcels identified as tax parcel 88.35-1-4.3 (80.8 acres) and tax parcel 88.35-1-4.1 (32.2 acres). The portion of the larger parent property that is the subject of this investigation includes the southern approximately one-half of tax parcel 88.35-1-4.3 (40.08 acres) and tax parcel 88.35-1-4.1 in its entirety, for a combined land area of approximately 72.3 acres. For purposes of discussion, the portion of tax parcel 88.35-1-4.3 that will be included in this investigation will be referred to as "the North Terminal", and the area encompassed by tax parcel 88.35-1-4.1 will be referred to as "the South Terminal". The North Terminal is situated with its northwestern boundary midway between Ontario Street and Ambrose Street, covering an area south to Ambrose Street. The South Terminal is located immediately south of Ambrose Street and south of the North Terminal. A Site Layout drawing,

depicting the relationship of the two parcels to one another, and the relationship of each to existing streets, Lake Ontario, and neighboring development is attached as Figure 2.

2.0 REMEDIAL INVESTIGATION ACTIVITIES

The former AFMC terminals consist of two separate parcels divided by Ambrose Street (the North Terminal and the South Terminal). The Remedial Investigation Work Plan presented a discussion of potential areas of concern organized by Parcel. The soil investigation was conducted in two phases. The first phase was completed in November and December 2007 and the second phase was completed in December 2008 through February 2009.

The investigation included drilling of a total of 185 borings by direct-push methods. A Geoprobe® Model 5400 was used to advance Macro-Core soil samplers, in 4-foot lengths, to refusal at the bedrock surface. The Macro-core samplers allow collection of continuous soil samples. The soil samples were then classified by an SE scientist, retained in two foot intervals for possible laboratory analysis and then screened with a photo-ionization detector (PID). A PID equipped with a 10.6 eV lamp was used to perform the headspace screening. Samples submitted for laboratory analysis were selected to help define areas of impact based on PID readings and also to confirm the absence of impacts in areas where PID screening and visual observation did not detect potential contamination of concern.

Samples submitted for laboratory analysis during the first phase of investigation (2007) were submitted to Environmental Laboratory Services, Inc. (ELS) of North Syracuse, New York, a NYSDOH ELAP certified laboratory. Samples from the second phase (2008-2009) were submitted for analysis to Life Science Laboratories of East Syracuse, NY (LSL), a NYSDOH ELAP certified laboratory. Soil samples submitted for laboratory analysis were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and lead by EPA Methods 8260, 8270 and 418.1, respectively. Those portions of each sample which were analyzed by EPA Methods 8260 and 8270 were also checked for the presence of tentatively identified compounds, or TICs, and only compounds on the NYSDEC STARS Memo #1 list were reported for the SVOC analyses.

3.0 NATURE AND EXTENT OF CONTAMINATION – SOUTH TERMINAL

The Remedial Investigation identified only a limited area of the South Terminal with petroleum-related VOCs in soil at concentrations exceeding Residential Use SCOs. This area is described below and shown on the attached Figure 2. Laboratory results for soil samples from the South

Terminal are summarized in Table 1. Boring Logs for both phases of investigation on both the North Terminal and South Terminal are included as Appendix A.

3.1 AOC 2 – Northeast of Former Valve House Area

This AOC encompasses the central northern portion of the South terminal which was the valve house area.

Approximately one hundred borings were advanced in the area around of the former valve house and across the surrounding areas. Approximately sixty-two of the borings showed elevated PID readings over 50 ppm. Soils above 4 feet depth showed minimal readings. Soil samples from select borings showing elevated PID readings were submitted for laboratory analysis. Laboratory analysis results of the fourteen soil samples collected revealed that although thirteen of the samples showed concentrations of at least one compound that exceeded Unrestricted Use SCOs, only one sample (SB-126) showed concentrations of any compounds (1,2,4-trimethylbenzene and xylenes) that exceeded Residential Use SCOs.

4.0 PROPOSED INTERIM REMEDIAL MEASURE

4.1 Soil Excavation

SE proposes to excavate soils exceeding Residential Use SCOs in AOC 2 and dispose of these soils at an approved off-site disposal facility. The estimated area of excavation is shown on Figure 2. Based on the limits of excavation shown on Figure 2, and an approximate contaminated soil thickness of two feet, it is estimated that a maximum of approximately 800 tons of soil will be removed for off-site disposal. An SE scientist will screen soils with a PID during excavation at each AOC. Soils exhibiting elevated PID readings will be sent off-site for disposal. It is anticipated that the soil will be disposed of at the Development Authority of the North Country (DANC) landfill in Rodman, New York. Clean soils as indicated by PID screening will be segregated for re-use as excavation backfill.

Excavation will begin in the center of the AOC at boring SB-126 and proceed outward until PID readings in the impacted soil layer drop below approximately 50 ppm.

Soil designated for off-site disposal will be temporarily staged on polyethylene sheeting adjacent to each excavation area. These soil piles will be covered with polyethylene sheeting at the end of each excavation day and will be covered daily until loaded onto trucks for transport and disposal.

Excavation areas will be backfilled to grade with segregated clean soils. If additional fill is needed, as was done for the IRM on the North Terminal, on-site uncontaminated soils from the former secondary containment berms on the North Terminal will be used. These soils will be screened with a PID prior to use as backfill. In addition, as required by NYSDEC DER-10, Technical Guidance for Site Investigation and Remediation, Section 5.4(e), samples of soil to be used for backfill will also be submitted for laboratory analysis of VOCs by EPA Method 8260 plus TICs. It is not anticipated that off-site fill will be necessary.

Air monitoring during excavation activities will be performed in accordance with the Community Air Monitoring Plan (CAMP) included as Appendix B.

4.2 Post-Excavation Soil Sampling

Soil samples will be collected from the contaminated soil horizon at the limits of the excavation prior to backfilling. Soil samples will be collected at a frequency of one sample for every 30 feet of excavation sidewall. Estimated sampling locations are also shown on Figure 2, but will be adjusted based on the final excavation dimensions. Sampling will be biased toward areas with higher PID readings. It is anticipated that excavation will be to the bedrock surface, so excavation bottom samples will not be collected.

Soil samples will be submitted for laboratory analysis of VOCs by EPA Method 8260 plus TICs. Samples will be submitted to a NYSDOH certified laboratory. NYSDEC ASP Category B deliverables will be provided and the data will be reviewed by an independent data validator.

4.3 Report

SE will prepare an IRM Report documenting excavation activities and presenting the results of post-excavation soil sampling. It is anticipated that the IRM Report, in conjunction with the RI/AA Report, will demonstrate that the South Terminal parcel meets Residential Use SCOs.

5.0 SCHEDULE

With approval of this IRM Work Plan, SE will solicit proposals from qualified contractors for transportation and disposal of contaminated soil. Excavation may be performed by qualified contractor. The goal is to complete excavation during the summer of 2010. The IRM report can be completed within 60 days of submission of post-excavation soil samples to the laboratory.

Notes

* All values are in mg/Kg or (ppm)
*Soil Cleanup Objectives (SCO) values are those issued from the NYS DEC's Division of Environmental Restoration
* ND - indicates that no contaminants were detected
* NT - indicates that the sample was not tested for that particular compound
* NE - guidance values not established by the NYS DEC
* E - indicates value exceeded laboratory instrument calibration range
* J - analyte detected below the PQL

TICs - Tentatively Identified Compounds
orange-shaded cells indicates target compound concentrations exceeding unrestricted use requirements
blue-shaded cells indicates target compound concentrations exceeding residential use requirements
Bold italisized font indicates that the target compound detection limit exceeds its corresponding guidance limit

Notes

* All values are in mg/Kg or (ppm)
*Soil Cleanup Objectives (SCO) values are those issued from the NYS DEC's Division of Environmental Restoration
* ND - indicates that no contaminants were detected
* NT - indicates that the sample was not tested for that particular compound
* NE - guidance values not established by the NYS DEC
* E - indicates value exceeded laboratory instrument calibration range
* J - analyte detected below the PQL

TICs - Tentatively Identified Compounds
orange-shaded cells indicates target compound concentrations exceeding unrestricted use requirements
blue-shaded cells indicates target compound concentrations exceeding residential use requirements
Bold italisized font indicates that the target compound detection limit exceeds its corresponding guidance limit

APPENDIX A

SOIL BORING LOGS

STRATEGIC ENVIRONMENTAL LLC

PROJECT: Sackets Harbor
PROJECT NO.: 06-742
LOCATION: Former AFMC Petroleum Terminal
Ambrose Street, Sackets Harbor, NY

DATE STARTED : 11/16/07
DATE COMPLETED : 11/16/07
LOGGED BY : J. Pentland
DRILLING COMPANY : SE, LLC
NAME OF DRILLER : S. Quimby

DRILLING METHOD : Geoprobe
RIG TYPE :
TOTAL DEPTH : 6.7 Feet
APPOX. GW DEPTH :
SAMPLING METHOD : Macro-Core

LOG OF BORING SB-1

Depth in (feet)	Blow Count	RECOVERY (inches)	USCS	GRAPHIC	DESCRIPTION	Depth of Change	DATE	MAX PID (ppm)	Core I.D.	COMMENTS
0					0.0 to 4.0 Feet: Light Brown medium to fine SAND, little Silt; moist; loose.		11-16-07	2	S-1	
4		30"			4.0 to 4.5 Feet: Similar Soil. 4.5 to 6.7 Feet: Dark Brown SILT, some Clay, trace medium to fine Sand; stiff; moist; moderately plastic; heavy petroleum odors near bottom.		11-16-07	343	S-2	
6		32"			*Bottom of Borehole a 6.7 Feet* **Refusal at 6.7 Feet**					

Note: Bgs. = Below Ground Surface.

ppm=parts-per-million
Depths noted are approx.

Soil classifications are based on visual and manual field observations only.
PID screening performed by headspace analysis methods with MiniRae Model 2000 with 10.6 eV lamp, calibrated to 100 ppm isobutylene/air.

ppm=parts-per-million
Depths noted are approx.
Depth of groundwater recorded on this log represents approx. depth at which saturated soil was encountered.

APPENDIX B

COMMUNITY AIR MONITORING PLAN

COMMUNITY AIR MONITORING PLAN
INTERIM REMEDIAL MEASURES
FORMER AFMC, INC. PETROLEUM BULK STORAGE FACILITY
AMBROSE STREET, SACKETS HARBOR, NEW YORK

NYSDEC ENVIRONMENTAL RESTORATION PROJECT
SITE NUMBER E-623014

The following establishes the air monitoring and action levels that are proposed to be incorporated into Strategic Environmental, LLC's Interim Remedial Measures (IRM) activities at the former AFMC, Inc. petroleum bulk storage terminal facilities located on Ambrose Street in the Village of Sackets Harbor, Jefferson County, New York. These provisions are intended to monitor and document concentrations of target contaminants in air within and downwind of the work site during IRM activities, and are intended to be incorporated into the Proposed Remedial Work Plan by reference.

Although it is not expected that the proposed IRM activities will create a significant threat of exposure to the local community, given the minimal degree of contamination documented during the remedial investigation; the limited nature of proposed excavation activities; and the considerable distance between the proposed work area and neighboring receptors; monitoring of air quality at the downwind perimeter of the work zones will be conducted, to confirm and document that the investigation activities do not result in migration of target airborne contaminants to the off-site downwind community.

A. <u>IRM Excavations – South Terminal</u>

During excavation activities, the worker breathing zones will be continuously monitored for airborne VOC and particulate matter, using a portable PID equipped with a 10.6 lamp (VOC) and a real-time aerosol monitoring (particulates). Concentrations of these analytes will also be recorded at an upwind location prior to and at periodic times during the excavation work, to establish local background levels.

In the event that VOC concentrations in the breathing zones are recorded to be sustained at or above 5 ppm for a period of 5 minutes or more, if measurable airborne particulates less than 10 microns in size are recorded at average concentrations at or above 100 micrograms per cubic meter (mg/m^3) more than upwind background levels over a fifteen (15) minute period, or if visible airborne dust is observed leaving the work area, work will be discontinued and provisions for upgrades of personal protective equipment and/or other site controls will be evaluated and implemented, as warranted.

In addition to worker breathing zone monitoring, VOC and particulate concentrations at the downwind fringe of the work zone, will be performed on a

real-time basis throughout the work periods. VOC monitoring will be conducted with the portable PID, and particulate monitoring will be performed using a real-time aerosol monitor.

If the downwind PM-10 particulate level is 100 micrograms per cubic meter (mcg/m^3) greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques will be employed. Work will continue with dust suppression techniques provided that downwind PM-10 particulate levels do not exceed 150 mcg/m^3 above the upwind level and provided that no visible dust is migrating from the work area.

If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 (mcg/m^3) above the upwind level, work will be stopped and a re-evaluation of activities will be initiated. Work will resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 (mcg/m^3) of the upwind level and in preventing visible dust migration.
