Re: Sloan Auto/90 Hopkins Street

Gentlemen:

Enclosed please find copies of the Sloan Auto/90 Hopkins Street property that were taken by EPA in August, 1998. EPA is currently evaluating the data to determine removal action eligibility at the property but is providing this data preliminarily for your information. Please contact me at (716) 873-5042 if you have any questions.

Sincerely yours,

A handwritten signature in black ink that reads "Kevin M. Mathels".

SUBJECT: Soil Sampling, Sloan Auto, Buffalo, NY  
WA# 3-382 - Trip Report

## BACKGROUND

The Sloan Auto site is located in the City of Buffalo in the State of New York. The property is located northeast of the Marilla Street Landfill at 90 Hopkins Street. The property is currently owned by the City of Buffalo and was obtained through tax foreclosure in approximately 1987. Malcolm Pirnie, Inc. performed soil sampling on 8 and 10 December 1997 to characterize two "lime" piles located on the property. A total of nine test pits were excavated to depths of approximately 20 feet below the top grade on the "lime" piles to physically characterize the fill conditions and collect samples for laboratory analysis.

Samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), TCL semivolatile compounds (SVOCs), Target Analyte List (TAL) metals, total cyanide, and pH. The results indicated that the constituents of the "lime" piles are very consistent throughout the depth of each pile. Acetone was the only VOC detected, however, it was below the New York State Department of Environmental Conservation (NYSDEC) Soil Cleanup Objectives and Cleanup Levels in Technical and Administrative Guidance Memorandum (TAGM) #4046. No SVOCs were detected.

Of the TAL metals, only beryllium, chromium, iron, and zinc were detected in concentrations slightly exceeding the NYSDEC Soil Cleanup Guidelines. The pH measured between 12.6 and 12.7.

The United States Environmental Protection Agency (U. S. EPA) Region II requested the assistance of the U.S. EPA/Environmental Response Team Center (ERTC) in performing a preliminary investigation of the surface and subsurface soils on site. The U.S. EPA/ERTC tasked the Response Engineering and Analytical Contract (REAC) to conduct this preliminary investigation.

## OBSERVATIONS AND ACTIVITIES

On 4 August 1998, REAC personnel mobilized to the Sloan Auto Site in Buffalo, NY. Sampling equipment was unpacked and a decon area was established. Thirteen sampling locations were chosen by the U.S. EPA/ERTC Work Assignment Manager (WAM) and the U.S. EPA Region II On Scene Coordinator (OSC) for surface and subsurface soil sampling. The thirteen locations were marked and numbered (1 through 13) with survey flags. In addition to the soil sampling, eight drums and one debris pile were sampled. Sampling locations are depicted in Figure 1.

Surface soil samples were collected using stainless-steel trowels and spoons. Soil samples, at depths of 6 inches to 3 feet, were collected using stainless-steel augers and spoons. Representative samples were placed into their appropriate glass jars for analysis. Samples were coded according to the depth sampled. Samples with an "A" were collected from the surface (0" to 6"), samples with a "B" were collected from 6" to 12" and samples with a "C" were collected from 12" to 36". Samples were analyzed for TCL VOCs, base neutral acid extractables (BNAs), TAL metals, and pesticides/polychlorinated biphenyls (PCBs). VOCs, BNAs, TAL metals, and pesticides/PCBs analysis was performed at the REAC laboratory in Edison, NJ.

Drums, located on site, were first labeled with an "R and a three digit number" using a "mean streak" grease marker. All the drums sampled were open to the elements. Contents of the drums were sampled using stainless-steel trowels and spoons. A representative sample was placed into an appropriate glass jar for analysis. Samples were analyzed for VOCs, BNAs, TAL metals, and pesticides/PCBs.

In addition to the soil and drum samples, surface (0" to 6") samples were collected from the two "lime" piles on site. Samples were collected using stainless-steel trowels and spoons. Samples were placed into appropriate glass jars and analyzed for pH, total cyanides, and pesticides/PCBs. Samples, for pH and total cyanides were analyzed by Blue Marsh Laboratories Inc., in Princeton, NJ. Samples for pesticides/PCBs were analyzed at the REAC laboratory.

All sampling equipment was deconned by the following steps: soap wash, rinse, nitric acid spray, hexane spray and air dry. Field Data Sheets are attached in Appendix A.

## RESULTS

The REAC Final Analytical Report is attached in Appendix B.

Results of the sampling are summarized in tables 1 through 17. A total of 23 soils, 8 drum, 4 "lime" and 1 debris pile samples were collected and analyzed.

## **DISCUSSION OF RESULTS**

Locations S-3 (surface), S-8, and S-10 were not sampled due to obstruction (i.e., concrete slab or gravel). The sample from S-5B was collected from an adjacent area (see Figure 1) due to a concrete slab at 3". Water was seen at locations S-4 and S-11 at depths of 3 feet and 1 foot, respectively.

R001 consisted of material (soils) composed from drums R001, R002 and R003. R004 consisted of material (soils) composed from drums R004, R005, and R006. Drum R007 contained a liquid with an oil layer.

Samples S-9B and S-9C are the only samples not to exceed the NYDEC TAGM #4046 Soil Cleanup Guidelines for all the parameters tested. The majority of the guideline exceedences took place in the TAL Metals and BNA analyses.

A high pH (12.4 to 12.45) was measured in the samples collected from the "lime" piles which is characteristic of a RCRA corrosive waste. Results of the total cyanides ranged from 1.9 milligrams per kilogram (mg/Kg) to 2.7 mg/Kg.

## **FUTURE ACTIVITIES**

No future activities are expected at this time.
