Re: Soils Summary

To whom it may concern,

A construction project commenced in November of 2021 at the above address to construct a 3,500 sf masonry addition on the north side of the existing building.

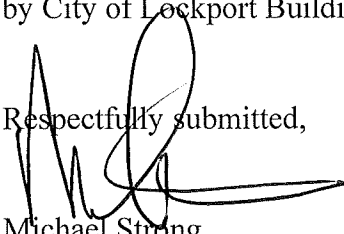

During the excavation for the foundation of the new addition, soil samples were first taken on November 09, 2021. These samples were taken from various locations of the new addition footprint by personnel from Reid Petroleum. A second round of samples were taken by the same personnel on November 23, 2021.

Analytical reports were prepared by Paradigm Environmental lab #205592 on December 02, 2021. The material based on the samples taken was classified as "Contaminated Soil".

During the foundation excavation 3 load of spoils were transported to 5894 Dunnigan Rd. Pendleton NY. Due to the structural nature of the spoils, the majority of excavation spoils, were used as backfill on site at 1 Niagara Street Lockport, NY.

On January 07, 2021 the three load of spoils which were stored at 5894 Dunnigan Rd, along with the balance of unused spoils from the 1 Niagara St jobsite were transported to the Waste Management Chaffee Landfill located at 10860 Olean Rd Chaffee NY. These spoils were transported by Mawhiney Trucking of Wilson NY. Total tonnage of contaminates soils transported to Waste Management Chaffee is 116.53 tons.

The addition project at 1 Niagara St Lockport, NY was completed and final inspections were performed by City of Lockport Building Inspection Department on February 16, 2021.

Respectfully submitted,

Michael Strong
