Dear Harry:

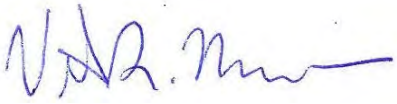
Enclosed you will find one hard copy of the above-referenced document. This document summarizes the findings generated as a result of the execution of the previously approved field work plan pertaining to the subject site. I believe this report can inform the adjustments needed to the existing October 2015 Remedial Action Work Plan (GES) as there is data in this document from areas of the site not previously accessible.

Once you have had a chance to review the document I would be more than happy to meet in person and discuss the findings and conclusions. I will be in touch in early October to discuss a possible meeting.

If you have any questions or require additional information before that time, please call me at 315.671.9256.

Sincerely,

Arcadis of New York, Inc.



Vincent S. Maresco, PG
Principal Geologist/Project Manager

1 INTRODUCTION

This Southern Terminals Investigation Summary Report summarizes the work performed, samples collected, and findings of data with respect to soil from the Southern Cold Springs Terminals (Southern Terminals), located south of Hillside Road. The Southern Terminals are comprised of the Southwestern and Southeastern Terminals. The study area is located on Hillside Road, Hamlet of Cold Springs, Town of Lysander, New York (Figure 1). The Investigation activities described in this document were performed during mobilizations in 2018 by Arcadis U.S., Inc. (Arcadis) and July 2013 by AECOM (2014) as detailed below.

The Investigation consisted of:

- The advancement of a group of 20 Laser Induced Florescence (LIF) probes across the study area (Figure 2);
- As requested by the New York State Department of Environmental Conservation (NYSDEC), the advancement of B122, located near a documented leaking underground storage tank (Figure 2); and
- The advancement of confirmatory borings CB-1 through CB-8 and CB-10 (Figure 2).

The investigation effort was performed in accordance with the Supplemental Characterization and Interim Remedial Action Work Plan (Arcadis 2018a) (Work Plan) and an updated work plan outline in the form of a letter plan. Both the Work Plan (Arcadis 2018a) and the letter plan were submitted to the NYSDEC for input, review, and approval prior to field implementation. The Work Plan (Arcadis 2018a) and the letter plan approvals from the NYSDEC are provided in Appendix 1. The goal of this work scope was to assess previously inaccessible areas of the Southern Terminals which recently became accessible as a result of the removal of former Southern Terminals infrastructure.

1.1 Overview and Summary

This document presents the findings of soil data collected across the former operational area of the Southern Terminals. Investigation methods included LIF, as well as laboratory analysis of soil samples. To evaluate possible spill source areas, the LIF findings and adsorbed-phase data are sorted into sample horizons in the unsaturated zone (above the water table) vs. those samples collected in the saturated zone (within the water table).

The following data observations and conclusions are drawn from this data set:

- Unsaturated Zone LIF: On the Southern Terminals, LIF responses from the 2018 locations are indicative of non-aqueous phase liquid (NAPL) in unsaturated soil (i.e., induced florescence responses > 5%) at all locations, except LIF2 and LIF9, on the Southwestern Terminal, and LIF15 through LIF18 on the Southeastern Terminal. All other 2018 LIF points advanced as part of this study indicated NAPL above the water table in the Southern Terminals historical operational areas. The LIF findings suggest that there are spill sources in various locations across the study area as discussed in detail below.
- Unsaturated Soil Data: Soil data collected from the confirmatory boring set CB-1 through CB-10 indicated unsaturated zone volatile organic compounds (VOCs) in exceedance of CP-51 standards,

criteria, guidance values, or objectives (SCGO) at all locations, except CB-1 and CB-2, on the Southwestern Terminal and at B122 on the Southeastern Terminal. All other CB locations indicated CP-51 VOC SCGO exceedances. These data findings represent a second line of evidence suggesting spill sources across the Southern Terminals study area.

- Saturated Zone Soil Data: Widespread saturated zone soil impacts are found across the Southern Terminals study area. All CB locations, with the exceptions of CB-8 and CB-10, indicated saturated zone CP-51 VOC SCGO exceedances.
- No semi-volatile organic compounds (SVOCs) were found in exceedance of CP-51 SCGO in either the unsaturated or saturated zone across the study area.

2 INVESTIGATION FIELD ACTIVITIES AND METHODS

Key work activities performed as part of this investigation are described under the following subsections:

Subsection 2.1 – Site Reconnaissance and Pre-Investigation Activities

Subsection 2.2 – LIF Probe Advancement Activities

Subsection 2.3 – Soil Boring and Sampling Activities

Subsection 2.4 – Survey

2.1 Site Reconnaissance and Pre-Investigation Activities

Tailgate pre-entry safety meetings and pre-entry site walks (reconnaissance) were conducted for each mobilization. The tailgate meetings were held to discuss the scope of work and coordinate logistics (site access, work hours, health and safety expectations, etc.). In each instance, the meeting was followed by a reconnaissance site walk to observe potential infrastructure locations and assess the location of any utilities, obstructions, or other logistical challenges that would cause scope modifications or delays. In certain instances, some sample locations were adjusted accordingly to site conditions to ensure work was completed in an efficient and safe manner. All adjustments that were made were considered minor or schedule-related, and only field status updates to the NYSDEC were required and provided.

Prior to each ground penetrating mobilization, Parratt-Wolff (drilling subcontractor) provided notification of ground disturbance, as required by law, to the New York Underground Facility Protection Organization (a.k.a. DigSafelyNY) for locating all subsurface utilities. Additionally, a private utility locator, Master Locators, used ground penetrating radar and electromagnetic detection tools to provide additional utility mark-out in the proposed area of B122. Also, for this location, hand-clearing / soft digging methods were used to a minimum of 5 feet below ground surface (bgs) before deploying mechanical soil collection tools.

2.2 LIF Probe Advancement Activities

To advance 20 LIF probe locations across the Southern Terminals study area, Parratt-Wolff, with the subject matter expert subcontractor, Dakota Technologies, drove each LIF probe location and collected LIF response data. To preserve data integrity from the unsaturated zone, the LIF tools were advanced in the subsurface at each location without pre-hand clearing / soft digging. This allowed data to be collected from undisturbed soil from grade to termination depth at each location. LIF response logs for each location are provided in Appendix 2. Each location was abandoned with bentonite chips following tool removal. Table 1 provides locational information for the LIF sample points. Table 2 provides LIF response data.

2.3 Soil Boring and Sampling Activities

Soil borings for locations B122 and CB-1 through CB-10 were advanced using direct-push drilling methods. CB locations were selected in part to confirm the LIF response data. Please note CB-9 was not able to be completed due to field conditions. Table 1 provides the locations for all completed soil borings. Soil samples were continuously collected from grade to terminal depth using 2-inch-diameter, 4-foot long

macro-core liners. All collected soil samples were field screened for VOCs using a field photo-ionization detector (PID). Select soil samples were retained and submitted for laboratory analysis. Table 3 presents PID results for soil samples; Table 4 provides laboratory analytical data results. Soil characteristics were continuously logged by an Arcadis geologist for texture, grainsize, moisture content, and the potential presence of impacts via field PID instrumentation. Each boring termination depth was determined in the field by the on-site Arcadis geologist. Termination depth for B122 was based on the field indication of the absence of impacts. as discussed in the Work Plan (Arcadis 2018a) (Appendix 1). For the purposes of this investigation, field determination of the absence of impact was established at 50 parts per million volume (ppmv) or less on the field PID. Termination depth for the CB series of points was based on water table plus approximately 4 feet additional depth. Total boring depths ranged from approximately 12 feet bgs to 20 feet bgs. All downhole tools were decontaminated by pressure washing between drilling locations on a temporary decontamination containment pad. Appendix 3 includes soil boring logs from B122 and CB-1 through CB-10.

Soil samples collected for laboratory analysis were analyzed by PACE Analytical Services, Inc. of Greensburg, Pennsylvania, for constituents listed in NYSDEC Policy CP-51: Tables 3 and 4 (Soil Cleanup Levels for Gasoline and Fuel Oil Contaminated Soils, respectively). Samples were also analyzed for methyl-tert-butyl-ether and ethanol.

Soil borings were abandoned by backfilling each borehole with pelletized bentonite to above the water table and finished to ground surface with soil cuttings.

2.4 Survey

All LIF and soil boring locations were surveyed by C.T. Male & Associates of North Syracuse, New York, a New York State licensed surveyor (Table 1).

3 SOIL BORING SAMPLING RESULTS

This section discusses the LIF responses and soil analytical data result findings by segregating them into unsaturated and saturated horizons to better understand the different parameters and factors influencing data results. The two vertical zones, unsaturated and saturated, are established based on a vertical evaluation of the location of the water table during data collection. Samples collected above the water table are those in the unsaturated zone, while samples collected within the water table are those in the saturated zone.

Evaluating results in this manner can support and infer the spill history at each sampling location. Samples collected above the water table (in the unsaturated zone) indicating SCGO exceedances are likely to demonstrate impact, which is locally or proximally sourced, while samples collected within the water table (in the saturated zone) generally detect impacts that have migrated with groundwater flow to the sampling location.

As discussed in the Work Plan (Arcadis 2018a), PID field findings were utilized to select which samples were retained for laboratory analysis. Laboratory analytical samples were selected on a positive bias basis, factoring in field water table indication as well as PID field data. Using this process, soil samples above the water table that indicated PID detections less than a 50-ppmv threshold were not universally retained for laboratory analysis. PID data is presented in Table 3.

3.1 Unsaturated LIF Results

LIF reflections indicating the presence of NAPL in the unsaturated zone were found at all of the LIF probe locations, with the exception of the following:

- Southwestern Terminal: LIF2 and LIF9; and
- Southeastern Terminal: LIF15 through 18.

The remaining LIF locations (a total of 14 additional locations) completed on the Southern Terminals all returned unsaturated zone LIF responses, suggesting the presence of NAPL in soil above the water table. Many of these locations were not previously evaluated due to the presence of historical Southern Terminals petroleum handling infrastructure. See Figure 3, which displays the relative 2018 LIF responses above the water table at each point.

In 2013, AECOM, on behalf of a group of Cold Springs settling defendants, collected LIF data in areas that were accessible at that time. This data was reported by AECOM in September 2014 (AECOM 2014). This data is re-presented in this document as the LIF data is of identical type and quality as the data collected in 2018. Figure 4 displays the AECOM-collected LIF data responses in the unsaturated zone. Note that the sample nomenclature of AECOM was UV-x while Arcadis used LIFx. Numerous areas investigated by AECOM indicated above water table LIF responses, suggestive of NAPL in the subsurface. It is worth noting that, in 2016, several soil borings were advanced in areas overlapping with the AECOM completed LIF points along Hillside Road. The results of those boring are presented in the Northern Terminal Focused Investigation Summary Report (Arcadis 2018b). Those samples document limited CP-51 SCGO exceedances in areas where AECOM LIF data suggests the presence of NAPL.

- Specifically, LIF unsaturated zone responses documented in 2013 at UV-01, UV-02, UV-06, UV-10, and UV-30 are not supported by 2018 analytical data results as no CP-51 SCGO exceedances are documented in the unsaturated zone in those areas of the site (see Arcadis 2018b).
- However, in other areas where LIF data overlaps with USEPA Method 8260 and USEPA 8270, there is better alignment to LIF responses and data results.

Conclusions about likely spill sources can be drawn for areas where there is stronger alignment of LIF response and analytical method results. These conclusions are discussed in Section 4 below.

3.2 Saturated LIF Results

Data from LIF points completed across the Southern Terminals Study area suggest that, in areas on both southern terminals, there are indications of NAPL impacts below the water table. This finding is indicated at LIF points LIF2, LIF3, LIF4, LIF10, LIF11, and LIF12 on the Southwestern Terminal and at LIF5, LIF7, LIF8, LIF14, LIF15, and LIF20 on the Southeastern Terminal. The remaining LIF probe locations completed as part of this investigation did not indicate elevated saturated zone LIF responses. See Figure 5, which displays the relative 2018 LIF responses below the water table at each point.

As noted above, the AECOM-collected LIF data has been combined with the data collected as part of this investigation. The saturated zone LIF findings from the AECOM data set are provided on Figure 6. These data indicate there are NAPL impacts at and below the water table in areas along Hillside Road and areas proximal to the former loading rack on the Southeast Terminal. Specifically, saturated zone NAPL was detected at UV-01, UV-02, UV-03, UV-04, UV-08, UV-11, UV-12, UV-15. UV-27D, and UV-29. At these locations, there are analytical laboratory results to support the findings at UV-01, UV-02, UV-03, UV-04, and UV-11 as CP-51 SCGO exceedances were found in saturated zone samples near these locations. There is no alignment of analytical data findings at the UV-6 area, and there are no comparative data for UV-08, UV-12, UV-27D, or UV-29.

In general, both LIF data sets suggest widespread saturated zone NAPL impacts, which is consistent with the project historical data interpretation.

3.3 Unsaturated Zone Adsorbed-Phase Results

As stated above, the unsaturated zone consists of the soil and corresponding samples above the groundwater table. This zone was evaluated by soil borings B122 and CB-1 through CB-10. These borings were sampled for VOCs and SVOCs via USEPA methods 8260 and 8270 respectively. Also, as noted above, the proposed location for CB-9 could not be completed due to site conditions and vegetation growth. See Appendix 4 for the associated laboratory analytical reports. The CB locations were selected to either add data where there was an absence of data or to confirm LIF findings.

3.3.1 Volatile Organic Compound Results

Soil borings completed on the Southern Terminals indicated widespread unsaturated zone CP-51 VOC range SCGO exceedances, which is consistent with the LIF findings from this area.

Specifically, only borings CB-1 and CB-2 had no unsaturated SCGO exceedances. Additionally, B122 did not have an unsaturated zone sample collected as there were no PID based field evidence of impacts above the water table. At locations where, total VOC concentrations were detected above SGCO they ranged from 1 compound exceeding SCGOs at 4.5-6 feet bgs at CB-8, with a total VOC concentration of 5,909 parts per billion (ppb), to 10 compounds exceeding SCGOs at 2-4 feet bgs at CB-6, with a total concentration of 1,256,030 ppb. As noted above, at location B122, there were no above water table PID responses over 50 ppmv, so there was no sample collected. This boring location was executed at the request of the NYSDEC in response to their observations of a failed underground storage tank in this area (Table 4 and Figure 7).

3.3.2 Semi-Volatile Organic Compound Results

Although there are SVOC detections in samples collected, there were no CP-51 SVOC SCGO exceedances detected in the unsaturated zone samples collected in the study area. Data are presented in Table 4 and on Figure 8.

3.3.3 Lead Results Soil Borings

At the request of the NYSDEC, total lead was included in all the borings completed across the study area. At each soil boring, the surface soil sample was retained for total lead. Lead concentration are reported on Table 4 and ranged from 3.6 ppm at CB-5 to 32.3 ppm at B122.

3.4 Saturated Zone Adsorbed-Phase Results

As previously noted, saturated zone samples are those that are collected at or below the water table at any given boring location. For the purposes of this data evaluation, samples that were located immediately above the field indication of depth to water were included in the group of samples that were considered in the saturated zone (capillary fringe). This process was meant to include the samples that were affected by water table fluctuations based on seasonal conditions. See Appendix 4 for all laboratory analytical reports.

3.4.1 Volatile Organic Compound Results

All boring locations indicated VOC range exceedances of SCGO with the exception of locations CB-8 and CB-10. At the soil boring locations where exceedances were found, concentrations ranged from 3 exceedances detected with a total VOC concentration of 16,883 ppb at 6-8 ft bgs at CB-7 to 8 compounds exceeding SCGO at CB-6 at the 4-5 ft bgs sample with a total VOC concentration of 1,476,600 ppb (Table 4 and Figure 9).

3.4.2 Semi-Volatile Organic Compound Results

There were no detections of semi-volatile compounds above the CP-51 SCGOs at any boring locations completed as part of this study. See Table 4 and Figure 10 for a presentation of these data findings.

4 CONCLUSIONS

As noted above, the soil findings have been divided up by compound class (VOC or SVOC) and vertical position with regard to the water table at each sampling location. Soil samples collected above the water table are described as unsaturated zone samples while soil samples collected within the water table are described as saturated zone samples. The reason for segregating the samples vertically with respect to the water table is to facilitate the ability to evaluate the samples with regard to likely spill history. Soils showing impact above the water table would have been impacted from a local or proximal source. This line of evidence of spill history is based on the idea that the major hydraulic transport mechanism for contaminants in the unsaturated soils is gravity and that soils impacted above the water table can only have been affected by a local petroleum spill or discharge event.

However, in the saturated zone there are more complex forces driving contaminant transport and migration, including the groundwater flow patterns and measurable NAPL thicknesses. Assessing the samples in this manner has the potential to allow for the interpretation of where there have been surface or near surface petroleum spills across the study area examined by this investigation.

The data collected as part of this investigation shows evidence of spill history in areas of the Southern Terminals that were not previously assessed. Historically, the presence of Southern Terminals petroleum storage and handling infrastructure had been an obstacle to a more complete site assessment. Following the removal of this infrastructure, including removal of above ground storage tanks, above ground pipe runs, below ground pipe runs, underground oil water separator, and a confirmed failed underground storage tank (at the B122 location), these areas could be investigated.

As discussed in detail above, the data collection methods including using LIF probe technology followed by confirmatory soil borings. Samples from the confirmatory soil borings were analyzed via USEPA methods 8260 and 8270 for CP-51 listed compounds in order to complete an evaluation against SCGOs.

4.1 LIF Responses

Unsaturated zone LIF responses provide information on the occurrence of NAPL in the soil matrix above the water table and thus suggestions on possible local spill sources. However, LIF technology is limited and subject to interference and thus should be confirmed with traditional laboratory USEPA methodology for detecting specific regulated compounds of concern in the environment. In general, the data set generated by the CB-1 through 8 and CB-10 borings and the B101 through 121 series of borings show strong alignment between LIF response for LIF-1 through LIF -20 and UV-01 through UV-32 with the following exceptions: UV-01, UV-02, UV-10, and UV-30. In these specific locations the laboratory data findings do not align with the LIF findings.

In locations where LIF data collected in the unsaturated zone from 2013 or 2018 align with soil boring findings, conclusions can be drawn with regard to likely suggested spill history. The following locations indicate spill history across the study area based on these lines of evidence.

- Southwestern Terminal: The maximum unsaturated LIF responses occur at LIF-3, LIF-4, LIF-10. and UV-20. These findings are interpreted to suggest one or more spill events at the loading rack and or the AST areas. Lower magnitude unsaturated zone LIF responses suggestive of NAPL are also found

at LIF11, LIF12, UV-17, UV-18 and UV-24. These data are interpreted to suggest lesser magnitude spill events in these areas of the site.

- In the buried underground pipeline Right-of-Way: The maximum unsaturated LIF responses occur at UV-15. Lesser magnitude unsaturated zone impacts are documented at UV-14 and UV-16. Collectively this data is interpreted to suggest a spill source in this Right-of-Way. See Arcadis 2018b for a discussion on adsorbed phase data and the limited unsaturated zone exceedances of SCGO in soil samples collected in this area of the site.
- Southeastern Terminal: The above water table LIF maximum responses are more extensive across the Southeastern Terminal than other areas investigated with findings both in the AST secondary containment area as well as the loading rack area. Maximum LIF responses in the AST area include LIF-1, LIF-7, LF-8, LIF-13, LIF-14, LIF-19, and LIF-20. At the loading rack area all LIF points suggest a spill source in this area. UV-3, and UV-26 through UV-29 all indicate LIF responses and are suggestive of NAPL in the above water table soil in this area of the site. This data is interpreted to suggest a spill history in multiple areas of the Southeast Terminal including the former AST area, former loading rack area, and based on visual observations made by the NYSDEC and reported to Arcadis, the area of the failed underground storage tank at B122.

Saturated zone LIF data indicated that the impacted horizons extend below the water table in several locations. As noted above, saturated zone data does not inform spill source conclusions, but must be considered when preparing remedial designs.

These data all support the conclusion that remedial efforts must address areas where these impacts have been documented. Data from these previously uninvestigated areas of the site must be incorporated into a revised Remedial Action Work Plan (GES 2015) for the site based on this updated dataset, and the entire plume area is accessible without the encumbrance of historic petroleum infrastructure.

4.2 Unsaturated Adsorbed Phase Contaminant Distribution

Unsaturated zone soil laboratory data is a second and confirmatory line of evidence for the LIF findings discussed above. In general, the LIF findings and the unsaturated zone laboratory data align well with a few notable exceptions as discussed above. The conclusions drawn about historical spill areas as well as areas that require a revisit of the site Remedial Action Work Plan (GES 2015) and design are supported by the unsaturated absorbed phase data distribution discussed above. Specifically, as noted above, areas previously unassessed on the Southern Terminals have now been confirmed to have impacts requiring remediation located above the water table in historic spill areas of the Site.

4.3 Saturated Zone Adsorbed Phase Soil Contaminant Distribution

Saturated zone absorbed phase impacts are widespread throughout the Southern Terminals area and will need to be considered when adjusting and finalizing the Remedial Action Plan (GES 2015) for the Site. Data provided herein document absorbed phase exceedances suggesting NAPL in soil within the water table at the Site and remedial actions will have to account for these findings. Both the LIF and laboratory data line up to indicate multiple lines of evidence that there are NAPL based impacts in this horizon.

Table 4
Summary of Soil Sample Analytical Results

Southern Terminal Investigation Summary Report
Southern Cold Springs Terminal
Lysander, New York

Notes:
1. Concentrations are presented in micrograms per kilogram, which is equivalent to part per billion except where otherwise noted.
2. Shaded and bold values indicate a criteria exceedance.
3. Field duplicate sample results are presented in brackets.

Lab Qualifiers	Definition
1c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
ip	Benzo(b)fluoranthene and benzo(k)fluoranthene were separated in the check standard but did not meet the resolution criteria in SW846 Method 8270D. Whereas sample results included are reported as individual isomers, the lab and the customer must recognize them as an isomeric pair.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
U	Indicates the compound was analyzed for, but not detected.
U1c	Indicates the compound was analyzed for, but not detected. A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
U2c	Indicates the compound was analyzed for, but not detected. The analyte did not meet the method recommended minimum RF.
Uip	Indicates the compound was analyzed for, but not detected. Benzo(b)fluoranthene and benzo(k)fluoranthene were separated in the check standard but did not meet the resolution criteria in SW846 Method 8270D. Whereas sample results included are reported as individual isomers, the lab and the customer must recognize them as an isomeric pair.
UL21c	Indicates the compound was analyzed for, but not detected. Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low. A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
UM6	Indicates the compound was analyzed for, but not detected. Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
NA	Not analyzed.
NA**	Sample was analyzed for total lead only.
VOC	Volatile organic compounds.
SVOC	Semivolatile organic compounds.
ug/kg	micrograms per kilogram.
mg/kg	milligrams per kilogram.

Dear Mr. Brazell:

Arcadis U.S., Inc. (Arcadis) has prepared this Focused Investigation Work Plan (Work Plan) for the Northern Cold Springs Terminal (the Northern Terminal) on behalf of Buckeye and BP. The purpose of this Work Plan is to collect and evaluate data to assist in determining remedial options and strategies for the Northern Terminal. The specific objective of the work described in this Work Plan is to better define subsurface stratigraphy, assess the nature and extent subsurface impacts within these focus areas, and study the groundwater-surface water interaction at the Site. This work plan proposes drilling soil borings and collecting soil samples for analytical testing, installing nested discretely-screened piezometers, and water-level monitoring. A detailed description of these activities is provided below. The activities will be conducted in accordance with New York State Department of Environmental Conservation (NYSDEC) Department of Environmental Remediation DER-10 (May 2010).

Areas of Investigation

To facilitate a focused remedial effort, the Work Plan has been broken into four distinctive study areas based on the location of known spills and the results of previous investigations (see Figure 1). These areas are as follows:

- Area 1 – Area proximal to monitoring well BMW5
- Area 2 – Former transfer pump area
- Area 3 – Delivery line right of way (ROW) between the two southern terminals
- Area 4 – Area proximal to monitoring well B18

1. Pre-Investigation Activities

Prior to initiating drilling activities public utilities will be marked out by contacting Dig Safely New York to locate and mark all utilities near the areas of investigation. A private utility locator will be also be contracted to provide additional utility mark out in the proposed areas of investigation. In accordance with Arcadis subsurface clearance policy, each drilling location will also be hand-cleared to a minimum of 5 feet below ground surface (bgs) before drilling.

Based on information learned from previous site investigations and available historic facility maps, there are three suspected distributions lines that run north-south though Area 3. These distribution lines will be uncovered by hand or soft digging methods at three separate points (northern, middle and southern regions) to visually verify their location, orientation, and direction. Proposed sample locations may be adjusted in an east/west direction based on proximity to utilities.

2. Soil Boring and Sampling Activities

This Work Plan proposes a total of 18 soil borings and installation of 6 nested piezometer pairs (B-101 through B-118 and PZ-101S/D though PZ-106S/D) throughout the four areas proposed for investigation (see Figure 2). Soil borings will be advanced using direct-push drilling methods. Soil samples will be continuously collected from grade to terminal depth using 2-inch diameter 4 or 5-foot long macrocores liners. Representative soils samples will be collected approximately every 2-feet and screened for volatile organic compounds (VOC) using a photo-ionization detector (PID). Soil characteristics will be logged continuously by a geologist for texture, grains size, moisture content, geologic origin, and the potential presence of impacts via field instrumentation. Each boring termination depth will be determined in the field by the on-site geologist and will be based on field indication of absence of impacts or 10 feet below first detection of the water table, whichever is shallower. For the purposes of this investigation field determination of absence of impact will be a detection of 50ppm on a field PID or less. Based on a review of historical data the anticipated terminal depth of each boring is estimated as follows:

Area 1 – Seven total soil borings, four in the northern portion to approximately 30 feet bgs and three in the southern portion to approximately 20 feet bgs

Area 2 – Six soil borings to approximately 18 to 20 feet bgs

Area 3 – Five soil borings to approximately 18 to 20 feet bgs

Area 4 – Six soil borings to approximately 22 feet bgs

Soil samples will be collected from each interval and analyzed by PACE Analytical Services, Inc. in Pittsburgh PA for constituents listed in NYSDEC Policy CP-51: Tables 2 and 3 (Soil Cleanup Levels for Gasoline and Fuel Oil Contaminated Soils, respectively). Samples will also be analyzed for methyl-tert-butyl-ether (MTBE) and ethanol.

Soil borings will be abandoned by backfilling each borehole with pelletized bentonite while removing the drilling tools. Soil cuttings generated during soil sampling activities will be temporally contained in 55-gallon drums on site in the northern portion of investigation Area 4. Composite samples of generated waste material will be collected for waste characterization analysis in accordance with applicable laws and regulations. All waste will be disposed of at an off-site location based on the results of laboratory analytical testing.

3. Groundwater/Surface water Interaction Activities

Six pairs of nested piezometers (PZ-101S/D through PZ-106S/D, 12 total piezometers) will be installed starting on the north side of Hillside Drive (Area 1, Area 2 and Area 4) and progressing into the ROW (Area 3), towards the Seneca River. These proposed locations are shown on Figure 3. Water-levels will be measured in the piezometers to better understand the groundwater-to-surface water interaction.

The soil borings for each of the piezometers will be drilled using the direct-push drilling procedure described above or a hollow stem auger rotary method. Piezometers will be constructed using 2-inch inside diameter (ID) schedule 40 polyvinyl chloride (PVC) material. Shallow piezometers (PZ-101S though PZ-106S) will extend to approximately 20 feet bgs and will be constructed with a 15 foot screen intended to straddle the water table (i.e., 10 feet below the average water table elevation and 5 feet above the average water table elevation). Deeper piezometers (PZ-101D though PZ-106D) will extend to the top of the glacial till or an elevation of 345 feet above mean sea level (amsl) (whichever is shallower). The deeper piezometers will be constructed using 2-foot long screens utilizing standard well construction methods with appropriately sized clean sand pack. An approximate 5-foot bentonite seal will be placed starting at approximately 1 foot above the piezometer screen.

Automatic pressure transducers will be installed inside each piezometer and in the two staff gauges installed in the Seneca River. One staff gauge will be installed along the nearby boat dock and the other along the bulk head near Area 3. Pressure transducers will allow collection of relatively continuous water levels over a several month period. Water levels will be evaluated to assess the magnitude and direction of hydraulic gradients (i.e., groundwater flow direction) in the horizontal and vertical direction. Measure groundwater levels at the same time as the surface water level in Seneca River will enable an evaluation of groundwater interaction with the river. Transducers will be installed in the piezometers and river gauges approximately one month prior to the opening of the NYS Barge Canal system and will collect data over the course of approximately three months.

Manual water-level measurements will be obtained at piezometers and river gauges once at the beginning of the study every week thereafter. All transducers will be inspected and data will be downloaded during the manual gauging events.

4. Survey

All soil borings, piezometers, and surface water measurement locations will be surveyed by a NYS licensed surveyor relative to the datum that has been established for the site. Survey information will be used to convert depths to elevations at each boring location and to establish reference elevations for each piezometer.

5. Reporting

The results of the activities described in this Work Plan will be presented in one final report which will summarize soil boring, sampling activities, and the groundwater-surface water interaction study. The report is anticipated to include, at a minimum, the following:

- Brief narrative describing the field activities, observations, and results
- Updated site plan showing the actual locations of all soil borings and/or piezometer locations
- Soil boring and piezometer logs
- Copies of laboratory testing reports
- Hydrographs of the transducer and manual water-level measurements (groundwater-surface water interaction report, only)

6. Schedule

Ideally field activities described herein will be initiated no later than March 2016, approximately one month prior to the target NYS Canal system opening in April 2016. The installation of piezometers, transducers and initiation of the groundwater-surface water interaction study will immediately follow the completion of the drilling activities. Groundwater and surface water monitoring activities will continue for a minimum of two months after the transducers are installed. The report discussed in Section 5 above will be submitted within approximately 60 days after completion of all field activities.

If you have any questions or require additional information, please call me at 315.671.9256.

Sincerely,

Arcadis of New York, Inc.

Vincent S. Maresco

1 INTRODUCTION

Arcadis U.S., Inc. (Arcadis) has prepared this Supplemental Characterization and Interim Remedial Action Work Plan (Work Plan) for the Cold Springs Terminals Site (Figure 1), on behalf of the Northern Terminal Group, in accordance with the Order on Consent effective October 19, 2017. The Work Plan also accounts for the recent demolition activities on the Southern Terminals, including the removal of aboveground tanks and piping, which now allows for further assessment of the surface and subsurface conditions in previously inaccessible areas.

The specific objectives of the work scope detailed in this Work Plan are as follows:

- Evaluate soil in areas previously unassessed.
- Provide the additional data to allow for the refining and updating of the scope of the October 1, 2015 Cold Springs Terminal Mutual Defense Group Remedial Action Work Plan (October 2015 RAWP).
- Conduct a site assessment of the Northern Terminal

To accomplish these goals, this Work Plan proposes the following tasks across both the Northern and the Southern Terminals:

Northern Terminal:

- Perform a monitoring well integrity survey on existing wells that are being used as part of the proposed site investigation activities and make repairs as needed based on findings;
- Conduct a groundwater sampling event using the existing wells;
- Installation of additional groundwater monitoring wells as proposed below;
- Completing an elevation survey of new wells;
- Conduct a comprehensive groundwater sampling event on the Northern Terminal; and,
- Data compilation, interpretation, and presentation.

Southern Terminals:

- Collect soil quality data via Laser Induced Fluorescence (LIF);
- Advance soil borings to correlate LIF findings to direct laboratory analytical samples;
- After the STG re-establishment of the performance monitoring well network, commence groundwater sampling in accordance with the October 2015 RAWP; and,
- Data compilation, interpretation, and presentation.

A detailed description of these activities is provided below. The activities will be conducted in accordance with New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation-10 (DER-10, Technical Guidance for Site Investigation and Remediation) (NYSDEC, 2010a) and, in the case of the Southern Terminal area groundwater monitoring program, per the October 2015 RAWP (Cold Springs Terminal Mutual Defense Group, 2015).

2 NORTHERN TERMINAL INVESTIGATION ACTIVITIES

2.1 Monitoring Well Integrity Assessment

A group of 11 wells currently existing on the Northern Terminal will be useful in understanding the current groundwater conditions of the Northern Terminal. These wells are listed on Table 1 and are depicted on Figure 2.

The first field action will be a monitoring well integrity survey of all existing Northern Terminal wells. This will be performed to assess the need for monitoring well repair, development, or replacement. The integrity survey will include the following:

- The overall condition of the well (labeled; condition of the well protective casing or well head and well pad; integrity of the surface seals; presence of the bolting or locking well cap, J-plug inner lockable cap, inner well riser casing, and survey mark)
- The comparison of measurable quantities (e.g., riser stickup relative to grade and well total depth)
- An assessment of the bottom sediment condition via probe feel and or bailer inspection
- Confirmation that each well listed in Table 1 is part of a survey data set and has known survey coordinates and elevation
- An initial measurement of the depth to liquid in each well

A monitoring well integrity assessment form, provided as Attachment 1, will be completed for each of the existing monitoring wells in this group.

2.2 Northern Terminal Existing Wells Groundwater Gauging and Sampling Event

The Table 1-listed wells are existing wells that have been selected to assist in assessing groundwater conditions on the Northern Terminal. Following integrity inspection and any needed repairs these wells will be gauged with an interface probe. The depth to water and, if detected, non-aqueous phase liquid (NAPL) thickness will be recorded and reported. Monitoring wells that are part of the sampling program and are free of NAPL will be purged of three well volumes and subsequently sampled using disposable bailers. The groundwater quality in each well will be evaluated using a multi-parameter water quality meter for temperature (degrees Celsius), pH (Standard Units), conductivity (milli-Siemens per centimeter), DO (milligrams per liter), and ORP (milli-Volts) and will be recorded to evaluate Monitored Natural Attenuation (MNA) indicators on site.

Groundwater samples will be collected from each of the well locations in accordance with DER-10 guidelines. Samples will be analyzed for NYSDEC STARS-listed volatile organic compounds (VOCs) via EPA Method Number 8260 including oxygenates, and ethanol and for semi-volatile organic compounds (SVOC) via EPA Method 8270. In addition, collected samples will be analyzed for selected MNA indicators, including nitrate/nitrite, sulfate, dissolved methane, alkalinity, dissolved ferrous iron, dissolved manganese, and carbon dioxide. Chain-of-custody documentation will be maintained for all collected samples. Collected groundwater samples will be analyzed by PACE Analytical Services, Inc., in

Greensburg, Pennsylvania (PACE), a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program-certified (ELAP) laboratory.

One set of quality assurance/quality control samples, including a blind duplicate, matrix spike, matrix spike duplicate, and trip blanks, will be collected at a frequency of one per 20 and submitted for laboratory analysis. Purge water and any NAPL generated by the monitoring activities will be containerized in properly labeled steel 55-gallon drums for off-site disposal.

2.3 Northern Terminal Utility Mark Out

Prior to initiating subsurface disturbance activities, public utilities will be marked out by contacting Dig Safely New York to locate and mark all utilities near the areas of investigation. A private utility locator will also be contracted to provide additional utility mark out in the proposed areas of investigation. In accordance with Arcadis' subsurface clearance policy, unless variances are agreed to between various parties, each drilling location will also be hand cleared to a minimum of 5 feet below ground surface before drilling.

2.4 Northern Terminal Soil Boring and Soil Sampling Activities

Areas of the Northern Terminal will be assessed via a direct-push or hollow stem auger soil boring program followed by installation of groundwater monitoring wells, as discussed in Section 2.5 below. The locations for these proposed boring locations coincide with the proposed 11 groundwater monitoring wells proposed for the Northern Terminal, as discussed below and shown on Figure 3.

Soil borings will be advanced using direct-push or hollow stem auger sample collection methods (either macro core or split spoon methods). Soil samples will be continuously collected from grade to terminal depth using 2-inch-diameter sampling tools. Representative soils samples will be collected approximately every 2 feet and screened for VOCs using a properly calibrated photo-ionization detector (PID). Soil characteristics will be logged continuously by an Arcadis geologist for texture, grain size, moisture content, geologic description, and the potential presence of impacts as detected via field PID instrumentation. Each boring termination depth will be determined in the field by the on-site geologist and will be based on the field indication of absence of impacts or 10 feet below the first detection of the water table, whichever is shallower. For the purposes of this investigation, field determination of absence of impact will be a detection of 50 parts per million (PPM) on a field PID or less. Based on a review of historical data, the anticipated terminal depth of each boring is estimated to be less than 25 feet.

Soil samples will be collected, at a minimum, from the interval with the highest PID reading above the water table and at the water table. Additionally, depending on field conditions and observations, samples may also be collected from additional intervals at each boring. All retained samples will be analyzed by PACE for constituents listed in NYSDEC Policy CP-51: Tables 2 and 3 (Soil Cleanup Levels for Gasoline and Fuel Oil Contaminated Soils, respectively) (NYSDEC, 2010b). Samples will also be analyzed for oxygenates and ethanol. Additionally, samples from the ground surface to 2 feet below ground surface will be analyzed for total lead.

Soil cuttings generated during soil sampling activities will be temporarily contained on and covered with plastic sheeting. Composite samples of the material will be collected for characterization analysis in

accordance with applicable laws and regulations. All materials will be disposed of at an off-site location based on the results of laboratory analytical testing.

2.5 Northern Terminal Monitoring Well Installation

As discussed above, additional groundwater monitoring wells are proposed for the Northern Terminal. There are 11 monitoring wells proposed throughout the Northern Terminal study area at the locations shown on Figure 3 and coincide with the locations for the soil borings discussed in Section 2.4 above. The soil borings for each of the monitoring wells will be advanced using a hollow stem auger rotary method. Wells will be constructed using 2-inch inside-diameter, Schedule 40, polyvinyl chloride (PVC) material. Monitoring wells will be constructed with a 15-foot screen intended to straddle the water table (i.e., 10 feet below the estimated average water table elevation and 5 feet above the estimated average water table elevation).

2.6 Northern Terminal Comprehensive Groundwater Sampling Event

Once the Northern Terminal monitoring wells have been installed and developed, they will be surveyed for horizontal coordinate and vertical (elevation) control. These newly installed 11 wells, along with the wells listed in Table 1, will be gauged with an interface probe and sampled in accordance with Section 2.2 above. It is estimated that the comprehensive northern terminal sampling event will take place approximately one quarter after the initial northern terminal sampling event.

Once a minimum of two and a maximum of four events of quarterly groundwater sampling have been completed, the data set will be evaluated. This evaluation will be used to generate a groundwater monitoring program for the Northern Terminal, as Northern Terminal groundwater monitoring was not contemplated in the October 2015 RAWP document. Following this initial set of up to four comprehensive groundwater data collection events and data evaluation, an updated and revised groundwater monitoring program will be proposed to NYSDEC for their review and consideration. This updated program will include a revised list of monitoring wells and analytical parameters for future proposed monitoring.

2.7 Northern Terminal Reporting

A report of findings summarizing the initial groundwater sampling event of the existing wells, the soil data collection, and the first comprehensive groundwater sampling event will be issued. This report will contain all relevant data noted above along with supporting attachments such as boring logs, well construction details, liquid level data, laboratory analytical reports. Additionally, data collected at the site in 2016 will be presented in this report of findings.

3 SOUTHERN TERMINALS INVESTIGATION ACTIVITIES

3.1 Southern Terminal Utility Mark Out

Prior to initiating subsurface disturbance activities, public utilities will be marked out by contacting Dig Safely New York to locate and mark all utilities near the areas of investigation. A private utility locator will also be contracted to provide additional utility mark out in the proposed areas of investigation. In accordance with Arcadis' subsurface clearance policy, unless variances are agreed to between various parties, each drilling location will also be hand cleared to a minimum of 5 feet below ground surface before drilling.

3.2 Southern Terminal Data Gap Area Assessment

This Work Plan proposes installing direct push soil penetrations across the Southern Terminals where data gaps exist. These borings will be conducted via LIF-type technology akin to the impact assessment work completed by AECOM in 2013 at the site. This data will allow for a three-dimensional understanding of the locations, and relative magnitude, of impacts across the data gap areas. The proposed locations of the LIF points are shown on Figure 5. Based on input and comments from NYSDEC, proposed LIF location #8 has been adjusted to line up with the former oil water separator structure that the NYSDEC removed from site during December 2017 – January 2018.

3.3 Soil Boring and Sampling Activities

Following collection and interpretation of the LIF data a brief summary memo will be prepared that would include a proposal for confirmation sampling. The LIF locations would be confirmed by approximately five (5) borings via traditional direct push or hollow stem auger advanced locations and collection of soil samples. This would allow for a calibration from the relative impact mapping provided by the LIF technology and actual compound-specific detections relative to Standards, Criteria, or Guidance values per NYSDEC Guidance Document CP-51. The final soil boring correlation sampling frequency determination will be made based on the results of the LIF data in conjunction with input from the NYSDEC.

Soil samples will be collected, at a minimum, from the interval with the highest PID reading above the water table and at the water table. Additionally, depending on field conditions and observations, samples may also be collected from additional intervals at each boring. All collected samples will be analyzed by PACE for constituents listed in NYSDEC Policy CP-51: Tables 2 and 3 (Soil Cleanup Levels for Gasoline and Fuel Oil Contaminated Soils, respectively) (NYSDEC, 2010b). Samples will also be analyzed for oxygenates and ethanol. Additionally, samples from the ground surface to 2 feet below ground surface will be analyzed for total lead.

In addition to the confirmatory boring set proposed here, four additional soil borings will be executed at the request of the NYSDEC as follows (Figure 5):

A boring will be added east of the small building located on the South East terminal (Figure 5) to characterize the impacts observed by the NYSDEC in this area during their removal of a 500-gallon consumptive use underground heating oil tank. The removal of the tank was conducted in

January 2018. Data collected from this boring will be analyzed via the same methods as all confirmatory borings being proposed.

Three shallow soil borings will be installed in the pipeline right of way located between the eastern and western southern terminals to collect shallow TCLP lead soil data quality. The most northerly of these samples will have two samples collected as follows: 0-2 feet below ground surface (fbgs) and 2-4 fbgs. The remaining two locations will have only the 0-2 fbgs sample collected.

A NYS licensed surveyor will be used to locate the LIF points as well as the soil borings installed on the southern terminal.

The results of the follow up, confirmation soil sampling plan may also suggest the installation of additional groundwater monitoring wells. Furthermore, the extended characterization of these areas should also support reevaluating the existing system design and layout especially with respect to the recent and substantial changes to the site access caused by the removal of the historic terminal above-ground infrastructure.

3.4 Southern Terminal Monitoring Well Network

Of the historic wells previously installed across the Cold Springs Terminals Site, 29 were listed in the October 2015 RAWP as wells required for system performance monitoring by the Southern Terminals Group (STG). This group of wells is listed on Table 2 and shown on Figure 4. 22 of these wells were located on the Southern Terminal properties and, as a result of recent demolition activities, have likely been compromised or lost. The remaining 7 wells are also of unknown condition. As such, baseline sampling and subsequent groundwater monitoring, as outlined in the October 2015 RAWP, will be conducted once the STG has re-established the system performance well monitoring network.

3.5 Southern Terminal Reporting

All the results of the activities described in this Work Plan will be presented in two reports as follows:

The first deliverable will be a memo summary of the LIF findings and will include a proposal for the confirmatory sampling program.

The second and final report will summarize LIF soil confirmation sampling activities. The report is anticipated to include, at a minimum, the following:

- A brief narrative describing the field activities, observations, and results
- An updated Site Plan showing the actual locations of all new surveyed soil borings
- Soil boring logs
- Copies of laboratory testing reports

Cc: Maresco, Vin <Vin.Maresco@arcadis.com>; Conlon, Benjamin (DEC) <benjamin.conlon@dec.ny.gov>; Greg Boltus <gboltus@action-technical.com>
Subject: RE: Report Submission on Behalf of Vin Maresco

Rebecca and Vin

I approve the Supplemental Characterization Interim Remedial Action Work Plan for the Cold Springs Terminal.

Currently the DEC, as part of the removal of the oil water separator on the southern terminal, continues to remove free product from the site. Two riser pipes have been installed that Action Technical is utilizing to remove the free product. I anticipate this activity to continue until there is no free product present or the Southern Terminal submits a revised work plan and commences work.

If you have any questions do not hesitate to contact me.

Good Evening Richard,

On behalf of Vin Maresco, attached is the Supplemental Characterization Interim Remedial Action Work Plan for the Cold Springs Terminals. Additionally, a hard copy of the report is scheduled to arrive at your office Monday. Vin is on vacation and will be returning Monday morning, until then please feel free to reach out to me with any questions.

Thank you,
Rebecca

Dear Mr. Warner:

Following up on our conversation from June 22, 2018, the attached Figure 1 proposes nine soil borings across the Southern Terminals. The purpose of these borings is to confirm the Laser Induced Fluorescence (LIF) findings in this area of the site and also to enhance the understanding of impacts in these areas. For your reference, the LIF findings are also summarized on the attached Figure 1.

Additional detailed findings from the May 2018 LIF data collection, including LIF boring logs, will be provided to the New York State Department of Environmental Conservation in the future. The May 2018 LIF data are summarized on Figure 1 so that you may evaluate the proposed nine boring locations.

This set of confirmatory borings are proposed, and will be sampled in accordance with the February 21, 2018 work plan. Pending your input on these proposed locations, the field work will be scheduled. Field execution timing will also be based on contractor availability.

If you have any questions or require additional information, please call me at 315.671.9256.

Sincerely,

Arcadis NA.

Proposed Confirmatory Soil Borings Workplan

Dear Mr. Maresco:

Thank you for providing the above referenced Confirmatory Soil Borings Workplan dated June 29, 2018 for the Cold Springs Terminals site in Lysander, New York.

The Department has determined that the workplan is satisfactory. Please notify the Department in advance before any field work begins to allow Department personnel the opportunity to be present during the activities outlined.

Should you have any questions, please contact me at (315) 426-7446 and thanks again for your efforts in continuing to move this project forward.

Sincerely,

Michael Belveg
Assistant Engineer (Environmental), Division of Environmental Remediation

APPENDIX 3

Soil Boring Logs

Date Start/Finish:	6/5/2018	**Northing:**	1141201.99	**Well/Boring ID:**	**B122**
Drilling Company:	Parratt-Wolff, Inc.	**Easting:**	909223.09	**Client:**	Cold Springs Terminal
Driller's Name:	Matt Carnie	**Casing Elevation:**	NA		
Drilling Method:	Direct Push / HSA	**Borehole Depth:**	20 feet bgs	**Location:**	Lysander, NY
Sampling Method:	2' x 2" Split Spoon	**Surface Elevation:**	372.15		
Rig Type:	Truck-Mounted Geoprobe Rig	**Descriptions By:**	Jeff Spradlin		

DEPTH	ELEVATION	Sample Run Number	Sample/Int/Type	Recovery	PID Headspace (ppm)	Geologic Column	Stratigraphic Description	Well/Boring Construction
	375							
0								
		1	0-5	5.0	0.0		Hand auger from 0-5' bgs. SAND, fine to medium, subangular to subround; some Gravel, rounded; loose, poorly sorted, light brown, no odor.	
	370							
5		2	5-7	1.2	31.4		Silty SAND; fine to medium, subangular to subround, medium dense, wet, light brown/gray, mild odor.	
	365	3	7-9	0.9	26.2		Silty CLAY and SAND, fine; moist, medium plasticity, light brown, mild odor.	
10		4	9-11	2.0	90.4		Silty SAND, fine; trace Clay; medium plasticity, wet, light brown, odor. No staining.	Backfilled from 0-20' bgs.
	360	5	11-13	2.0	400.5		Stronger odor.	
		6	13-15	2.0	85.3		Silty SAND, fine to medium, subangular to subround, medium dense, light brown, odor, wet.	
15								

Remarks: ags = above ground surface; bgs = below ground surface; NA = Not Applicable/Available; HSA = Hollow-stem augers.

ARCADIS Design & Consultancy for natural and built assets

Client: Cold Springs Terminal

Well/Boring ID: **B122**

Site Location:
Lysander, NY

Borehole Depth: 20 feet bgs

DEPTH / ELEVATION	Sample Run Number	Sample/Int/Type	Recovery	PID Headspace (ppm)	Geologic Column	Stratigraphic Description	Well/Boring Construction
	7	15-17	2.0	405.2		Silty SAND, fine to medium, subangular to subround, medium dense, light brown, odor, wet.	
355	8	17-19	2.0	286.4			Backfilled from 0-20' bgs.
	9	19-20	1.0	26.9		Increasing density, trace odor.	
20						Refusal at 20' bgs. End of boring.	
350							
25							
345							
30							
340							
35

RE: Project: Cold Springs
Pace Project No.: 30255017

Dear Vin Maresco:
Enclosed are the analytical results for sample(s) received by the laboratory on June 06, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

QUALIFIERS

Project: Cold Springs
Pace Project No.: 30255017

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-PA	Pace Analytical Services - Greensburg

BATCH QUALIFIERS

Batch: 301538

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: 301539

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

1c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

RE: Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Dear Vin Maresco:
Enclosed are the analytical results for sample(s) received by the laboratory on August 03, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-10 (4-6)_080118 **Lab ID: 30261182001** Collected: 08/01/18 15:40 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1638 Roseytown Road - Suites 2,3,4
Greensburg, PA 15601
(724)850-5600

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-10 (6-8)_080118 **Lab ID: 30261182002** Collected: 08/01/18 15:40 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-6 (2-4)_080118 **Lab ID: 30261182004** Collected: 08/01/18 16:45 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1638 Roseytown Road - Suites 2,3,4
Greensburg, PA 15601
(724)850-5600

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-8 (6.5-8)_080118 **Lab ID: 30261182007** Collected: 08/01/18 14:20 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1638 Roseytown Road - Suites 2,3,4
Greensburg, PA 15601
(724)850-5600

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-5(2-4)_080118 **Lab ID: 30261182010** Collected: 08/01/18 12:40 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1638 Roseytown Road - Suites 2,3,4
Greensburg, PA 15601
(724)850-5600

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-1(4-6)_080218 **Lab ID: 30261182023** Collected: 08/02/18 11:40 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

Pace Analytical Services, LLC
1638 Roseytown Road - Suites 2,3,4
Greensburg, PA 15601
(724)850-5600

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-3(2-4)_080218 **Lab ID: 30261182026** Collected: 08/02/18 09:00 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

ANALYTICAL RESULTS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

Sample: CB-4(5.5-7.5)_080218 **Lab ID: 30261182029** Collected: 08/02/18 09:50 Received: 08/03/18 09:20 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.
Comments: • Samples in this workorder were received in the laboratory without an associated trip blank.

QUALIFIERS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-PA	Pace Analytical Services - Greensburg

BATCH QUALIFIERS

Batch: 308677

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: 308678

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: 308894

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

1c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
2c	The read back of the low concentration calibration standard for this compound is not within 30% of the true value. The results may be biased low and should be considered estimated
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M6	Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
S0	Surrogate recovery outside laboratory control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
ST	Surrogate recovery was above laboratory control limits. Results may be biased high.

Greensburg, PA 15601
(724)850-5600

QUALIFIERS

Project: Liverpool Terminal-Cold Spring
Pace Project No.: 30261182

ANALYTE QUALIFIERS

ip Benzo(b)fluoranthene and benzo(k)fluoranthene were separated in the check standard but did not meet the resolution criteria in SW846 Method 8270D. Whereas sample results included are reported as individual isomers, the lab and the customer must recognize them as an isomeric pair.
