Re: Court Street Parking Garage IRM Vent System - Work Plan final layout

Dear Ms. Peachey:

On September 22 we sent you proposed additions to the vent system layout for the Court Street Parking Garage Project and in a follow-up October 20 letter provided the rationale for the vent system expansion. Your November 23 response indicated that the final plans for the vent system would be dependent on the results of verification soil samples collected on November 7. We provided our sample results for locations V8 to V16 to Todd Caffoe on December 6 and received the NYSDEC split sample results (V8 to V12) the following day from Todd. Copies of the analytical data are provided in Attachment 1.

Table 1 is a summary of the soil analytical data indicating results for those locations where contaminants were detected by either the NYSDEC or City analyses. I have included the previous test pit data from soils just to the north of the November 7 verification sampling area as well. No characteristic site contaminants, petroleum or chlorinated solvents related to dry cleaning, were detected at V8, V9, V10, V12, V13, V14, V15, or V16. Figure 1. is a sample location drawing

The results indicate that, in all but one location, the upper six inches of the remaining three feet of soil are not contaminated. Of the recent verification sampling, the only location where volatile organic compounds exceed STAR's guidance values was at V-11. The test pit data and our experience with excavating soils at this elevation (502-506 fmsl) suggests that some low-level contamination may be present at depths greater than six inches. However, the remaining 2 - 2.5 feet of soil do not exhibit the heavy staining or the sustained strong odors encountered at the apparent source area (the stone lined sump pit discovered at elevation 517-519 fmsl) or just above the dense glacial till (elevation 514-516 fmsl). At this point, we would propose that the soil conditions indicated by the verification data do not warrant the active ventilation system proposed in September or require removal. The garage excavation process has resulted in the removal of the source area and all heavily contaminated soil within the footprint of the garage. We believe the intent of the removal action described in the approved work plan has been met.

Based on observations of the shoring on the north side of the garage excavation, we do, however, now propose to install a 62 foot section of 4-inch diameter slotted schedule 40 PVC vent pipe between the foundation and the shoring along the eastern end of the north side of the garage. A

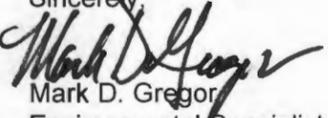

EEO Employer/Handicapped

revised proposed vent system layout is presented in Figure 2. In this area we have observed staining of the lagging and occasional small seeps of the same dark brown liquid possessing a petroleum solvent odor that was detected at various times during the soil removal process. The new section of vent pipe would be located above the garage perimeter drain system. The vent pipe would help prevent the accumulation of vapors in the drain system. The perimeter drain system is piped to a central drain location beneath the lower level of the garage where it runs through sand separators before being pumped to the storm sewer in Court Street. In addition to installing the vent pipe, we believe that it will be appropriate to periodically inspect the drain system and the sand separators for the possible presence of contamination from material entering the perimeter drain system.

We would like to determine the final system layout as soon as possible so that materials can be ordered, and we will provide the detailed drawings and specifications as soon as they are ready. Please let me know if you or Todd have any questions or would like to discuss the proposed revisions to the vent system. Thank you.

Sincerely,

Mark D. Gregor

ATTACHMENT 1

ORGANICS QUALIFIERS - 1991

- U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture.
- J - Indicates an estimated value. The flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
- N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compound, where the identification is based on a mass spectral library search.
- P - This flag is used for a pesticide/Aroclor target analyte when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a "P".
- C - This flag applies to pesticide results where the identification has been confirmed by GC/MS.
- B - This flag is used when the analyte is found in the associated blank as well as in the sample.
- E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis.
- D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and ALL concentration values reported on that Form I are flagged with the "D" flag.
- A - This flag indicates that a TIC is a suspected aldol-condensation product.
- X - As specified in Case Narrative.

December 5, 1994

LAB NAME: Ecology and Environment, Inc.

CASE NUMBER: RH894

SDG NUMBER: 11207

CONTRACT NUMBER: C003181

SAMPLES IN SDG: 08 09 10 11 12

SDG NARRATIVE:

Enclosed are the analytical results for samples received at the Analytical Services Center on November 9, 1994. The samples were analyzed for the following parameter according to NYSDEC Analytical Services Protocol, September 1989, Revision 12/91:

Volatiles Method 8260

Electronic deliverables are not available for this analysis.

Two chromatograms are provided for each sample in this data package. One eliminates the early eluting carbon dioxide peak.

Due to hydrocarbon interference, the bromofluorobenzene surrogate recovery was calculated using the 174 ion.

2-chloroethylvinyl ether was not included in the calibration standards. It was not detected in any of the samples as a target compound or tentatively identified compound.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Gary Hahn - Manager
Analytical Services Center
December 5, 1994
