Re: REVISED Summary of Investigation - Soil Vapor Intrusion Study
333 Smith Street (a.k.a. 50 Marcus Drive, Melville)
Farmingdale, New York
NYSDEC Site # V-001521

Dear Mr. Stewart:

On behalf of RXR Realty LLC (RXR), Roux Associates, Inc. (Roux Associates) has prepared the following revised Summary of Investigation for a soil vapor intrusion study conducted at 50 Marcus Drive/333 Smith Street in Farmingdale, New York (Site). The soil vapor intrusion study was conducted between March 22, 2008 and March 27, 2008 in accordance with Roux Associates' January 4, 2008 "Vapor Intrusion Evaluation Work Plan" as approved by New York State Department of Environmental Conservation (NYSDEC) and New York State Department of Health (NYSDOH) on January 24, 2008. Additional data regarding recommendations for further actions have been added to the end of the report. This Recommendation section describes the active system reinstallation, proposed initial monitoring, and a Contingency Plan to be undertaken if the newly installed system does not achieve the mitigation objectives.

Background

Three separate engineering controls have been employed at the Site to maintain acceptable indoor air quality. An epoxy floor covering was applied to the concrete slab, maintenance of the interior positive air pressure via the facility's forced air HVAC system, and the installation of a sub-slab venting system were completed prior to the build out of the new office space in January 2001. The epoxy floor coating consisted of a 13-mil thick 100% solids epoxy that was applied to the top surface of the concrete slab and joint sections. The facility's HVAC system was designed like most office buildings to provide a positive pressure atmosphere inside the building and is controlled by a Building Management System to ensure that an appropriate air exchange rate and a positive pressure gradient between the indoor air and the exterior environment are maintained. The passive sub-slab venting system consists of two venting wells to a depth

of approximately 15 feet below the land surface and is connected to the roof exhaust points through the vent risers leading to 4" diameter wind-driven rotary turbine ventilator.

In addition, from October 2000 to January 2003, twelve indoor air monitoring events were completed to check the effectiveness of the controls. It was concluded that the engineering controls implemented at the facility are effectively maintaining acceptable indoor air quality.

Scope of Work

The purpose of this vapor survey was to identify vapor concentrations in and under the building slab using the October 2006 NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in the State of New York."

Three tasks were completed during the investigation (original Task 3 and Task 4 were condensed into Task 3) and include:

- Task 1: Pre-Sampling Inspection, Location Stakeout and Utility Clearance Activities
- Task 2: Verify the Operation of Existing Sub-Slab Ventilation System
- Task 3: Collection and Analysis of Sub-Slab, Ambient Indoor and Outdoor Background Air Sample

Discussion

Task 1: Pre-Sampling Inspection, Location Stakeout and Utility Clearance Activities

On February 28, 2008, Roux Associates personnel met with the NYSDOH, the building owner, and tenant representatives to select the locations of the sub-slab sampling points. The property is occupied by a two-story 164,000 square foot building currently used as office space for Arrow Electronics, Inc. Prior to the installation and sample collection, a product inventory to list potential chemical interferences and the NYSDOH Indoor Air Survey were completed. The survey included recording occupancy and described the location and operational conditions of the building's heating, ventilation, and air conditioning system (HVAC). The building contains many computer servers, copy machines, and cleaning materials.

Task 2: Verify the Operation of Existing Sub-Slab Ventilation System

During the sampling event, Roux Associates located the two vent stacks from the existing sub-slab depressurization system and took photoionization detector (PID) measurements from each. The resulting readings from the two stacks were 2.6 parts per million (ppm) at the stack near the air duct and 1.8 ppm at the other vent stack. The "radius of influence" well, which was a well that was installed to help determine the radius of influence of the sub-slab ventilation system, was not located in the loading dock area on the western side of the building.

Task 3: Collection and Analysis of Sub-Slab, Ambient Indoor, and Outdoor Background Air Samples

The six sampling points were installed on March 22, 2008 through 1-1/2 inch diameter holes that were cored through the four-inch thick concrete slab floor. Teflon-lined tubing (sample tubing) was set to a depth of two inches below the concrete slab (in the sub-slab material). Sand was used to fill in around the bottom two inches of the sample tubing. The remaining space was filled with Bentonite® and quick cement to seal the sampling point to just below the surface. The sampling point tubing was capped off with Masterflex® and a ziptie just below the grade of the floor. The carpet tile was then replaced over the point.

Prior to sampling the soil vapor points, the integrity of the sampling point seals were tested using helium as a tracer gas. This step is conducted as a quality assurance/quality control measure to verify that the soil vapor sample would not be compromised by entrainment of ambient air into the sample. Crayola® Modeling Clay was used to seal the enclosure where the sample tubing meets the surface. Soil vapor was purged from the point using an air pump calibrated to approximately 0.1627 liters per minute (L/min) while the sampling point was covered at the surface with a small enclosure that was partially filled with helium. The soil vapor discharging from the air pump and the air within the enclosure were continuously monitored for helium during purging. The sampling point seals were determined to be intact as there were no detections of helium in the soil vapor at any of the six points.

On March 27, 2008, eleven samples were collected concurrently: six sub-slab soil vapor samples (SS-1, through SS-6), four indoor ambient air samples (A-1 through A-4), and one outdoor ambient air sample (B-1), which was collected outside the southern wall of the building. All samples were collected in six-liter Summa canisters with flow-controlling regulators over an eight-hour period. Samples were collected anywhere between 6:30 P.M. (March 27th) and 4:00 A.M. (March 28th) (depending on start times) over an eight-hour sample collection period.

SS-1 was collected in a conference room behind the entryway door (on the Northwest corner of the building) in close proximity to indoor air sample A-1, which was collected from the conference room table. SS-2 and SS-5 were set up on the north and south sides of the atrium, respectively. SS-2 was set approximately 8 feet from the windows near the atrium. Both points were sampled in vacant cubicles. SS-6 and A-4 were collected in the cafeteria on the Southwest corner of the building, where A-4 was collected on a table nearby SS-6. SS-4 and A-3 were collected in a vacant cubicle approximately 9-1/2 feet from the windows along the southeast corner of the building. A-4 was set on a filing cabinet (approximately four feet above ground level). SS-3 was collected around an empty space between two cubicles while A-2 was collected in a vacant cubicle adjacent to SS-3 and set on a filing cabinet, located in the northeast corner of the building. Sampling locations are shown on Figure 1. This timeframe was selected so that the samples were collected while the building was unoccupied by employees to minimize

interference with VOC sources (e.g. colognes, hairsprays, etc.). The HVAC system was set to run under typical daily settings to simulate conditions representative of those when employees are present.

At the beginning of sampling, the indoor and outdoor atmospheric pressures were measured to be 30.02 inches of mercury (inHg). At the end of sampling, the indoor and outdoor atmospheric pressures were measured to be 29.83 inHg. Weather data including wind speed and direction was taken from the National Weather Service's reporting station in Farmingdale, New York (KFRG) and was recorded on an hourly basis throughout the eight-hour sampling period.

All six (6) soil vapor samples were collected by connecting tubing from the soil vapor sampling point to a Gilian GilAir-5 pump calibrated to 0.1627 L/min and a six-liter Summa canister using a disposable three-way valve. The valve leading to the Summa canister was initially closed and the valve leading to the vacuum pump was opened, allowing the soil vapor sampling point to be purged of approximately three tubing volumes of soil vapor. Following purging, concentrations of VOCs in the sub-slab soil vapor were screened using a PID. At SS-1, PID readings were 0.4 ppm, SS-2 PID readings were 0.2 ppm, SS-3 PID readings were not reported, SS-4 PID readings were 0.6 ppm, SS-5 PID readings were 0.5 ppm, and SS-6 PID readings were not reported. Following screening, the valve leading to the pump was closed and the valve leading to the Summa canister was opened. The soil vapor sample was collected in the Summa canister with a laboratory calibrated flow-controlling regulator over an eight-hour period. After the eight-hour period, the canister data sheet was completed.

Soil vapor and air samples were sent to AccuTest Laboratories of Dayton, New Jersey and analyzed for VOCs using USEPA method TO-15.

Results

Analytical results for VOCs in soil vapor and ambient air are presented in Attachment 1, summarized in Table 1, and discussed below. Analytical results for samples collected during this Soil Vapor Intrusion investigation were evaluated using the NYSDOH's October 2006 "Guidance for Evaluating Soil Vapor Intrusion in the State of New York" ("NYSDOH Guidance").

A total of thirty VOCs were detected in the samples. The indoor air samples (A-1 to A-4) (Table 1) had twenty-one (21) detections, the background sample (B-1) had eighteen (18) detections, and the sub-slab air samples (SS-1 to SS-6) had twenty-six (26) detections.

The NYSDOH has developed two matrices found in Section 3.4 of the NYSDOH Guidance that addresses indoor air contamination for four VOCs including carbon tetrachloride, tetrachloroethene (PCE), 1,1,1-trichloroethane (1,1,1-TCA), and trichloroethene (TCE).

All four of the aforementioned VOCs were found in the samples. Carbon tetrachloride was found only in the background sample B-1 at the value 0.75 $\mu g/m^3$ with the qualifier J, which means that it's an estimated value. PCE was found in both sub-slab soil vapor samples from 149 $\mu g/m^3$ in SS-3 to 10,800 $\mu g/m^3$ in SS-1 and in indoor air from 0.88J $\mu g/m^3$ in A-1 to 1.5 $\mu g/m^3$ in A-3.

The laboratory data was independently validated and the resulting report can be found as Attachment 2. The data table has been modified to reflect the results in the validation report.

Conclusions

According to Matrix 2 of the Guidance for Evaluating Soil Vapor Intrusion in the State of New York dated October 2006, the combination of PCE concentrations in sub-slab soil vapor and PCE concentrations in indoor air, result in "MITIGATE" as the required action.

Recommendations

System Reinstallation

As a result of the NYSDOH Matrix, the existing SSD system will be converted from a passive venting system to an active venting system to duplicate the system that was previously installed as detailed in the Louis Berger report "Active Sub-Slab Vapor Extraction Monitoring Report" dated August 2002. The components of the sub-slab venting system that will be reinstalled include a 3hp blower, particulate pre-filter, moisture knock out drum, and associated appurtences. The system will be installed on the existing piping leading to Vapor Extraction Wells 1 and 2. Any water collected in the moisture knock out drum will be containerized and disposed of properly.

Monitoring

Once the system is active, at least 30 days from the installation and proper adjustment of the system and within the heating season, post-mitigation sampling will be completed according to Section 4.3.1 and will include indoor and outdoor air monitoring to duplicate the sampling completed on March 28, 2008. At that time, radius of influence sampling will also be completed using the existing six (6) soil vapor monitoring points that were installed throughout the building as part of the work done in March 2008.

Contingency Plan

If it is determined that the radius of influence does not completely extend beneath the areas of the building where previous contamination was found, according to Section 4.2.2 (f) (3), a complementary air monitoring program may be instituted to confirm that exposures are being addressed adequately while the SVE system is operating or if needed, an addition to the existing SSD system will be assessed.

If you have any questions concerning this report, please do not hesitate to contact us.

Sincerely,

REMEDIAL ENGINEERING, P.C.

Notes:

µg/m^3 - Micrograms per cubic meter

Bold data indicates that parameter was detected

N - Analyte present that has been "tentatively identified"

J - Estimated value

V - Data added and/or value altered by data validator

U - Compound was analyzed for but not detected

Vinyl Acetate		5.6 U	5.6 U	5.6 U	5.6 U	8.1 U
Vinyl chloride		4.1 U	4.1 U	4.1 U	4.1 U	5.9 U
Xylenes (total)		**37**	**21**	**27**	**21**	**13**

Notes:

µg/m^3 - Micrograms per cubic meter

Bold data indicates that parameter was detected

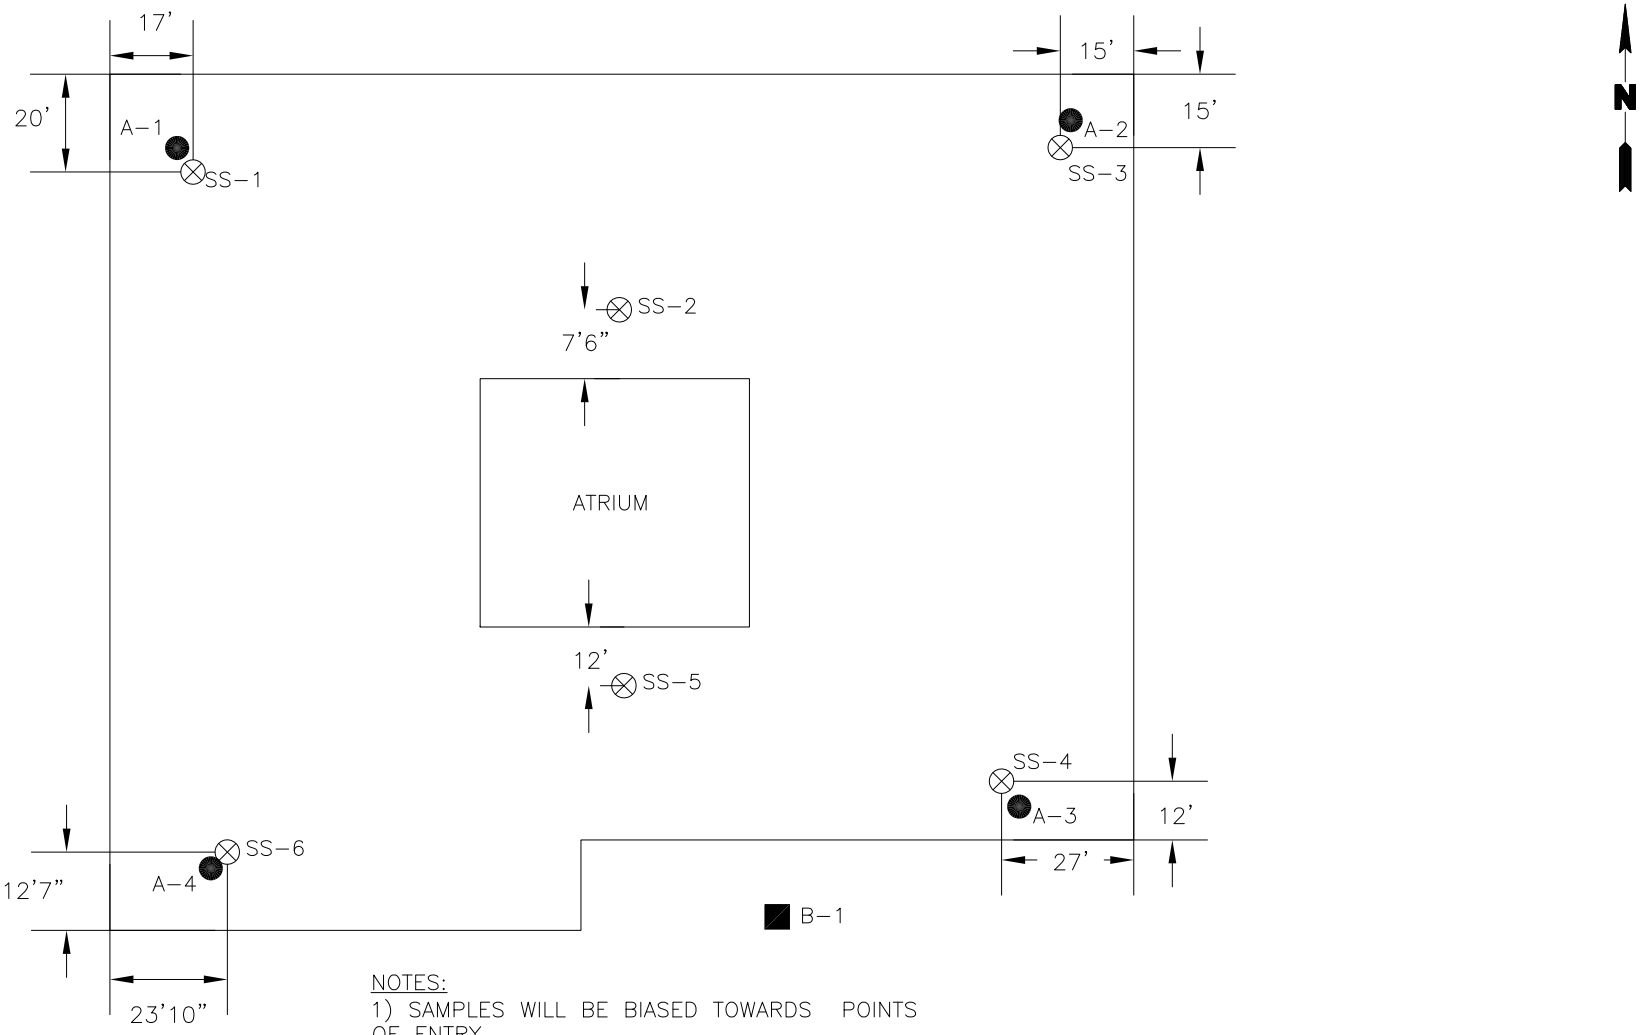
N - Analyte present that has been "tentatively identified"

J - Estimated value

V - Data added and/or value altered by data validator

U - Compound was analyzed for but not detected

N:\PROJECTS\REC702Y\REC06Y\103\REC0610301.DWG



NOTES:

1) SAMPLES WILL BE BIASED TOWARDS POINTS OF ENTRY.
2) BACKGROUND SAMPLE WILL BE TAKEN ON WINDWARD SIDE OF BUILDING
3) SAMPLE SS-1 TO BE INSTALLED BEHIND DOOR IN CONFERENCE ROOM
4) SAMPLE SS-2 TO BE INSTALLED IN CUBICLE OUTSIDE LACTATION ROOM
5) SAMPLE SS-3 TO BE INSTALLED IN BETWEEN CUBICLES
6) SAMPLE SS-5 TO BE INSTALLED IN CUBICLE ACROSS FROM ATRIUM
7) SAMPLE SS-4 TO BE INSTALLED IN EMPTY CUBICLE ACROSS FROM WINDOW
8) SAMPLE SS-6 TO BE INSTALLED IN CAFETERIA

RE: Validation of 50 Marcus Dr. analytical data package
Accustest Laboratories SDG J86976

Dear Ms. Tyll:

Review has been completed for the data package generated by Accutest Laboratories that pertains to samples collected 3/27/08 and 3/28/08 at the 50 Marcus Dr site. Eleven 6-L summa canisters were analyzed for volatiles by EPA method TO-15.

The data package submitted by the laboratory contains full deliverables for validation, and the data have been fully validated with guidance from the 2006 USEPA Region II validation SOP HW-31, and in consideration of the specific requirements of the analytical methodology. The following items were reviewed:

* Data Completeness
* Case Narrative
* Custody Documentation
* Holding Times
* Surrogate and Internal Standard Recoveries
* Blank Contamination
* Laboratory Control Sample (LCS) Recoveries and Duplicate Correlations
* Instrumental Tunes
* Initial and Continuing Calibration Standards
* Method Compliance
* Sample Result Verification

Those items showing deficiencies are discussed in the following sections of this report. All others were found to be acceptable as outlined in the above-mentioned validation procedures, and as applicable for the methodology. Unless noted specifically in the following text, reported results are substantiated by the raw data, and generated in compliance with project requirements.

In summary, sample processing was conducted in compliance with project requirements. Sample results are usable either as reported, or with minor qualification due to typical processing or matrix effects.

A copy of the laboratory case narrative is attached to this text, and should be reviewed in conjunction with this report. Also attached are sample result forms with recommended edits and qualifiers applied in red ink.

Volatile Analyses by EPA TO-15 and EPA 8260B

Holding times and instrument tunes meet requirements. Blanks show no contamination. Surrogate and internal standard responses are within required ranges. Initial and continuing calibration standard responses are acceptable.

Due to very poor mass spectral quality, the following detections are edited too reflect non-detection, sometimes at elevated reporting limits (corresponding to the initially reported concentration):

- t-butyl alcohol and chloromethane in B-1
- chloromethane in A-1

Due to poor mass spectral quality, the following detections are qualified as being tentative in identification and estimated in value. The specific results should be used with caution:

- dichlorodifluoromethane in A-3
- propylene in SS-3 and SS-4

Non-project Batch QC matrix spikes (MSs) show acceptable recoveries and correlations, with the exception of one slightly high duplicate correlation value. Project results are unaffected. Spiked control recoveries are within required ranges.

Reported values are substantiated by the raw data.

Please do not hesitate to contact me if questions or comments arise during your review of this report.

Very truly yours,

Judy Harry

VALIDATION QUALIFIER DEFINITIONS

DATA QUALIFIER DEFINITIONS

The following definitions provide brief explanations of the national qualifiers assigned to results in the data review process. If the Regions choose to use additional qualifiers, a complete explanation of those qualifiers should accompany the data review.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N - The analysis indicates the present of an analyte for which there is presumptive evidence to make a "tentative identification".

NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client: Roux Associates **Job No** J86976

Site: Reckson, 50 Marcus Drive, Farmingdale, NY **Report Date** 4/25/2008 11:26:51 AM

On 03/29/2008, 11 Sample(s), 0 Trip Blank(s) and 0 Field Blank(s) were received at Accutest Laboratories. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of J86976 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. This report has been upgraded per client reuqested dated on 4/25/2008.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Volatiles by GCMS By Method TO-15

Matrix AIR **Batch ID:** V2W759

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) J87694-1DUP were used as the QC samples indicated.
- RPD(s) for Duplicate for Tetrachloroethylene are outside control limits for sample J87694-1DUP. RPD acceptable due to low DUP and sample concentrations.

Matrix AIR **Batch ID:** V2W760

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) J87930-3DUP were used as the QC samples indicated.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover
