Public Comment Period Extended and Public Meeting Announced for Proposed Remedy at Voluntary Cleanup Site

Public Meeting, Thursday, 3/6/2014 at 7:30 PM
Dowling College's Brookhaven Campus 1300 William Floyd Parkway, Building B, Room 201
 NYSDEC invites you to a public meeting, being held by the East Yaphank Civic Association, to discuss the proposed remedy to address contamination at the site. You are encouraged to provide comments at the meeting, and during the comment period described in this fact sheet.

The New York State Department of Environmental Conservation (NYSDEC) has released a proposed cleanup plan for the Yaphank (LIRR) site ("site") located at E. of River Rd, S. of RR Tracks, Yaphank, Suffolk County. Please see the map for the site location. Documents related to the cleanup of this site can be found at the location(s) identified below under "Where to Find Information."

How to Comment

NYSDEC is accepting written comments about the proposed plan, from **January 22, 2014** through **March 14, 2014**. The proposed plan is available for public review at the location(s) identified below under "Where to Find Information." Please submit comments to the NYSDEC project manager listed under Project Related Questions in the "Who to Contact" area below.

Draft Remedial Action Work Plan and Proposed Decision Document

The cleanup plan is described in NYSDEC's Proposed Decision Document, which is based on a more detailed "Remedial Action Work Plan". The proposed remedy consists of:

Based on the remedial action objectives (RAOs) defined for the site and adjoining impacted properties and the nine remedy selection factors presented in NYSDEC DER-10 Guidance the proposed remedial alternative described in the following paragraphs best meets the selection criteria:

The proposed remedy will include placement of a 1-foot soil, stone, or concrete cover over the fill material on portions of the LIRR property, on the adjacent property to the southeast of the site (Cement Plant), and placement of a 1-foot asphalt cover on the adjoining property to the east of the site (Asbestos Transfer Company). The placement of these covers will require the excavation of soil/fill before placement of the cover systems in areas where the existing ground surface elevation cannot be significantly altered.

The proposed remedy also includes the excavation of fill material above Residential Use SCOs from the adjacent undeveloped residential property to the south and replacement with clean fill.

The excavated soil/fill will be consolidated on the western two acre portion of the LIRR property. The consolidated soil/fill in the western area of the site will be capped with an impermeable engineered cap. This cap will consist of an asphalt and plastic membrane "crown" and a fabric formed concrete revetment and plastic membrane on the side slopes. This will also serve as an effective low permeable cap to cover the portion of the site that has exhibited the highest metal concentrations based on the completed investigations.

Additional drainage enhancements are part of the design, and will convey the storm water run-off from the site area to several drainage basins. Other engineering and institutional controls will be implemented to monitor and maintain the cap, covers, site access, and site use.

Additional Details

The remedial construction will involve the excavation and movement of approximately 9500 cubic yards of soil and fill. This will take place on site or on the properties immediately adjacent to the site. You may notice increased truck traffic, heavy excavation equipment, water spraying, dust monitoring, fence construction, and placement of plastic sheeting and asphalt pavement.

The proposed remedy was developed by the Voluntary Cleanup Program (VCP) volunteer after performing a detailed investigation of the site under New York's VCP.

Summary of the Investigation

A Site Investigation was conducted to delineate the nature and extent of contamination. Soil and groundwater samples were collected on and off-site. These samples identified and delineated the contamination associated with the site. The contamination consisted of inorganic contamination (primarily lead, arsenic, zinc, and copper) that is present in the fill disposed of at the site. This fill is also present at off-site properties immediately adjacent to the site. Groundwater is contaminated on-site by site-related contaminants but site-related contaminants do not affect groundwater off-site.

Next Steps

NYSDEC will consider public comments, revise the plan as necessary, and issue a final Decision Document. New York State Department of Health (NYSDOH) must concur with the proposed remedy. After approval, the proposed remedy becomes the selected remedy. The draft Remedial Action Work Plan and Proposed Decision Document are revised as needed to describe the selected remedy, and will be made available to the public. The volunteer(s) may then design and perform the cleanup action to address the site contamination, with oversight by NYSDEC and NYSDOH.

NYSDEC will keep the public informed throughout the investigation and cleanup of the site.

Background

Location: This site lies along the railroad tracks east of the hamlet of Yaphank, in the Town of Brookhaven. The site is south of the rail road tracks immediately east of River Road.

Site Features and Land Use: The site is about four acres in area. The site has no structures and is fenced off from trespassers. The site is zoned for transportation with adjacent properties zoned for industrial, commercial, and residential uses.

Past Use of the Site: This site was used by the Long Island Railroad from the 1950s until the 1970's as an unauthorized disposal area of contaminated fill and debris. Soil and groundwater samples were collected from the site in the early 1990's. A Preliminary Site Assessment (PSA) was conducted in 1998/99. The results of the PSA indicated that fill disposed of at the site had also extended to off-site areas. The site entered into the Voluntary Cleanup Program in 2002.

Site Geology and Hydrogeology: The fill material disposed of at the site is up to 25 feet thick and overlays the native soils consisting of sands, gravels, and clays to a depth of approximately 1700 feet below grade. The groundwater is about 10 to 30 feet below grade depending on the surface elevation and flows to the south-southwest.

Additional site details, including environmental and health assessment summaries, are available on NYSDEC's website at:

<http://www.dec.ny.gov/cfm/xtapps/derexternal/haz/details.cfm?pageid=3&progno=V00384>

Voluntary Cleanup Program: New York's Voluntary Cleanup Program (VCP) was developed to encourage private sector volunteers to investigate and clean up contaminated properties and return these sites to productive use. Once cleaned up, the properties may be redeveloped for commercial, industrial, residential or public use.

For more information about the VCP, visit: <http://www.dec.ny.gov/chemical/8442.html>

We encourage you to share this fact sheet with neighbors and tenants, and/or post this fact sheet in a prominent area of your building for others to see.

Receive Site Fact Sheets by Email

Have site information such as this fact sheet sent right to your email inbox. NYSDEC invites you to sign up with one or more contaminated sites county email listservs available at the following web page: <http://www.dec.ny.gov/chemical/61092.html>. It's quick, it's free, and it will help keep you *better informed*.

As a listserv member, you will periodically receive site-related information/announcements for all contaminated sites in the county(ies) you select.

Note: Please disregard if you already have signed up and received this fact sheet electronically.
