Re: Remedial Investigation Results and Supplemental Workplan
Safeguard Storage Properties LLC Facility
1170 Atlantic Avenue, Baldwin, N.Y. 11510
VCP # V00523

Dear Mr. Putnum:

P.W. Grosser Consulting Inc. (PWGC) has prepared the following correspondence to document the work completed under the Final Remedial Investigation Work Plan, December 24, 2003 prepared by ATC Associates Inc. (ATC) at the above referenced site for Safeguard Storage Properties LLC (Safeguard). As we have recently discussed, PWGC has been retained to complete the investigation activities at the referenced site and have submitted a Work Plan under your review for sub-slab and indoor air sampling at the site. This work was originally performed by ATC, however deemed unacceptable by your Department.

Other tasks included in the ATC Work Plan have also been completed and the results previously submitted to your Department under separate cover. Other work has been completed by ATC, however, the results have not been submitted, and finally some work has yet to be performed. The purpose of this report is to clarify the work that has been performed, transmit data collected by ATC that has not been forwarded to your Department, and to present an updated Work Plan for tasks to be completed by PWGC. PWGC has modified the tasks to be completed originally presented by ATC, however, we intend to follow the Health and Safety and Quality Assurance/Quality Control Plans established by ATC in the December, 2003 Work Plan.

COMPLETED WORK

- As mentioned above, ATC performed Indoor Air and Soil Vapor Investigation Activities detailed in section 4.5 and 4.10 of their December, 2003 Work Plan. The results of this investigation were transmitted to the New York State Department of Environmental Conservation in a March 9, 2006 report. Upon review, the NYSDEC determined that the methods specified in the Work Plan were not followed and the results were not accepted. PWGC has submitted a Work Plan in October 2006 to properly complete these tasks and are awaiting your Departments approval.

- ATC performed initial groundwater vertical and horizontal delineation activities. These initial activities included groundwater samples collected using hydraulic direct push probe methods as detailed in Section 4.1 of ATC's Work Plan in December, 2004. The purpose of these activities was to determine the depths of proposed groundwater monitoring wells. It is believed that these results were submitted to the NYSDEC for review. However, ATC believed that based on these results, further vertical delineation activates were warranted in the vicinity of the former inactive drywell to determine the depths of the proposed permanent deep monitoring wells. The supplemental vertical delineation work was performed by ATC using a hollow stem auger drill rig during the week of April 12, 2005. This information was also submitted to the NYSDEC for review.

- The results of the investigation performed under Section 4.1 were to be used to finalize the installation of permanent groundwater monitoring wells described in section 4.2. ATC originally proposed two (2) groundwater well couplets and four new shallow groundwater monitoring wells. Based on NYSDEC review, the Department recommended that two (2) groundwater monitoring well clusters be installed with three (3) distinct depths. The depths include the deepest depth of 100 feet below ground surface (bgs), a mid depth of approximately 50 feet , and at the water table encountered between four (4) and six (6) feet bgs. ATC further recommended the installation of six shallow monitoring wells (3 replacement and 3 new wells) to be completed under section 4.2. PWGC presents a revised monitoring well installation plan later in this document.

- PWGC performed a site inspection/magnetometer survey in an effort to locate the monitoring wells believed to be paved over or destroyed at the site. The inspection was performed on August 1, 2006. During the site inspection, PWGC located MW-1 installed at grade and MW-2 installed as a stick up well. The wells were in somewhat disrepair. During the inspection, PWGC located what was believed to be MW-1 below the parking lot and received a response on the magnetometer from the general area where MW-3 was believed to be located. PWGC returned on August, 25, 2006 along with Associated Environmental Inc. (Associated), to repair MW-1 and MW-2 and to attempt to locate and repair MW-3 and MW-4. Associated dug in the area of MW-3 however; this well was not located and is believed to be destroyed. PWGC was successful in locating MW-4. This well was repaired by installing a new flush mount casting, cover, and new j-plug. The well was checked by inserting a bailer and found to be fully functional. Stick-up well MW-2 was repaired by removing the above grade well housing and loose riser. A new flush mount casting, cover, and j-plug was also installed on this well. Finally, MW-1 was repaired by cutting two inched off the well riser so that the casting cover would properly sit on the casting. A new j-plug was also installed on this well. All three wells were determined to be capable of providing representative groundwater samples from the beneath the site (see **Figure** 1 for monitoring well locations).

- Section 4.3 (Groundwater Flow Direction and Tidal Influence Survey), 4.6 (Hydraulic Conductivity tests), 4.7(Biodegradation Indicator Compound Collection and Analysis), and 4.8 (Contaminant Fate & Transport Modeling) of ATC's December, 2003 Work Plan have not been completed. These tasks were to be conducted following the monitoring well installation phase. Work to be completed at the site will be discussed later in this document.

- Section 4.4 (Surface Soil Sampling) was conducted by ATC in March, 2005. A total of seven (7) surface soil samples (SS-1 – SS-7) were collected from the 0-6 inch interval from the locations shown on **Figure 1**. In addition, samples of bottom sediment were collected from the three active catch basins (CB-1 – CB-3). The samples were collected in accordance with the ATC Work Plan and analyzed for VOC's by EPA Method 8260, SVOC's by EPA Method 8270, pesticides by EPA Method 8081, and Target Anlayte List (TAL) metals (priority pollutant metals were analyzed for in the catch basins). The samples were analyzed by AmeriSci Boston, Weymouth, MA. The results of the analyses are presented on **Table 1**, and the laboratory data sheets are included in **Appendix A**. As shown on **Table 1**, no VOCs or pesticide compounds were detected above NYSDEC recommended soil clean-up objectives (RSCO) contained in the TAGM 4046 memorandum. In general, low levels of SVOC compounds indicative of developed areas were detected in the samples, with the exception of SS-6. Although concentrations in this sample were higher than the others, the sample was collected below asphalt thereby eliminating exposure. In addition, the concentrations may reflect the incorporation of asphalt in the sample. A number of metals including beryllium, copper, mercury, selenium, and zinc were detected at elevated concentrations within the samples. For the most part beryllium and selenium were detected within Eastern USA Background concentrations, while mercury concentrations were all below 2 mg/kg. The concentration of metals likely reflect historic fill material used at the site. Overall, the sediment within the catch basin showed similar results, with only minor detections of SVOC's and relatively low levels of metal compounds detected.

In accordance with their Quality Assurance Plan (QA/QC), ATC collected and analyzed a number of QA/QC samples in association with the surface soil samples described above. These samples include a field blank (FB) sample and a trip blank (TP) sample. AmerSci Boston also reported the results of their internal storage blank sample, which is their policy (most labs do not report this result separately). The storage blank is created by the laboratory and stored with the environmental samples. As appropriate the FB sample includes the analyses specified for the surface soil samples (VOC's, SVOC's and TAL metals), while the TB and storage blanks samples were analyzed for VOC's. The results of the QA/QC sampling reflect that the detection of methylene chloride in the environmental samples is likely a laboratory artifact. Overall, the data submitted by AmeriSci met the project data quality objectives and are usable to determine the presence, absence, and magnitude of environmental contamination in the samples collected from the site. The QA/QC laboratory data sheets are also included in **Appendix A**.

- Section 4.9 (Characterization of Previously Identified Areas of Concern) was conducted by ATC in April, 2005. A total of nine (9) soil samples were collected from five (5) locations. With the exception of SS-7, each Area of Concern (AOC) sample consisted of a 0-2 inch and a 5- 6 foot sample interval. At the SS-7 location, only a 0-2 inch interval was sampled. The locations of the samples are shown on **Figure 1**. The samples were collected in accordance with the ATC Work Plan and analyzed for VOC's by EPA Method 8260, SVOC's by EPA Method 8270, pesticides by EPA Method 8081, and TAL metals. The results of the analyses are presented on **Table 2**, and the laboratory data sheets are included in **Appendix A**. As shown on **Table 2**, no VOCs or pesticide compounds were detected above NYSDEC RSCO's. In general, low levels of SVOC compounds indicative of developed areas were detected in the shallow (0-2 inch) samples. The levels of SVOC's were significantly reduced or below detectable concentrations in the deeper sample intervals. A number of metals including beryllium, copper, mercury, selenium, and zinc were detected at elevated concentrations within the samples. For the most part beryllium and selenium were detected within Eastern USA Background concentrations, while mercury concentrations were all below 2 mg/kg. The concentration of metals likely reflect historic fill material used at the site.

  In accordance with their QA/QC Plan, ATC collected and analyzed a number of QA/QC samples in association with the previously identified AOC soil samples described above. These samples include a FB and TP sample (AmerSci also reported the storage blank sample). As appropriate the FB sample include the analyses specified for the AOC soil samples (VOC's, SVOC's and TAL metals), while the TB and storage blanks samples were analyzed for VOC's. The results of the QA/QC sampling reflect that the detection of methylene chloride in the environmental sarnples is likely a laboratory artifact. Overall, the data submitted by AmeriSci met the project data quality objectives and are usable to determine the presence, absence, and magnitude of environmental contamination in the samples collected from the site. The QA/QC laboratory data sheets are also included in **Appendix A**.

- Section 4.11 (Sediment and Surface Water Samples from Milburn Creek) was completed by ATC in March 2005. Four (4) sediment and four (4) surface water samples were collected from the locations depicted on **Figure 1**. As shown on **Figure 1**, SED/SW-1 was collected on the east side of the site in the vicinity of CB-1, while SED/SW-2 was collected immediately offshore of the drywell of concern. SED/SW-3, and SED/SW-4 ware collected off of the south and west end of the site, respectively. The samples were collected in accordance with the ATC Work Plan and analyzed for VOC's by EPA Method 8260, SVOC's by EPA Method 8270, and TAL metals. The results of the analyses are presented on **Tables 3 and 4**, and the laboratory data sheets are included in **Appendix A**. As shown on **Table 3**, no VOC were detected above their NYSDEC RSCO's in the sediment samples collected. A number of SVOC and metal compounds were detected above their respective RSCO. However, the concentrations detected appear to be of typical background sediment quality in highly developed areas, as the canal is subject to heavy boat traffic and is located adjacent to a major roadway subject to runoff. In addition, the highest metal

concentrations were detected on the west side of the canal, on the opposite side of the drywell of concern. The results of the surface water samples, as shown on **Table 4**, did not identify VOC's, SVOC's, or metal compounds in excess of applicable standards. This surface water body is not used for drinking and is brackish in nature based on sodium levels in the 8,000 mg/kg range. Therefore, standards for fish propagation in saline waters were used.

In accordance with their QA/QC Plan, ATC collected and analyzed a number of QA/QC samples in association with the sediment and surface water samples described above. These samples include a FB sample, TP sample, and two storage blank samples. As appropriate the FB sample include the analyses specified for the AOC soil samples (VOC's, SVOC's and TAL metals), while the TB and storage blanks samples were analyzed for VOC's. The results of the QA/QC sampling reflect that the detection of Acetone in the environmental samples is likely a laboratory artifact. Overall, the data submitted by AmeriSci met the project data quality objectives and are usable to determine the presence, absence, and magnitude of environmental contamination in the samples collected from the site. The QA/QC laboratory data sheets are also included in **Appendix A**.

WORK TO BE COMPLETED

As mentioned above, work included in the ATC December, 2003 Work Plan that has not yet been completed includes monitoring well installation, groundwater sampling, and interpretation of data associated with groundwater monitoring. This work was originally outlined in Sections 4.2, 4.3, 4.6, and 4.8 of the approved Work Plan. At this time, PWGC wishes to modify the work included in these sections with the following scope of work:

PWGC proposes to install three water table monitoring wells at the site. One well will be installed in the vicinity of the southeast corner of the site as shown on **Figure 1.** This well will serve as a replacement for MW-3, while providing groundwater elevation data at the south end of the site. The remaining two (2) water table wells will be installed in the vicinity of the drywell of concern in the proposed locations of the well couplets proposed by ATC. The total of six monitoring wells will be used to monitor groundwater conditions at the water table, verify groundwater flow patterns, and to determine the influence on groundwater flow from the surrounding surface water bodies.

The wells will be installed so that their screens intersect the water table. The wells will be screened using 10 foot long (7 feet within and 3 feet above the water table) of 0.01 inch slotted 2 inch diameter Schedule 40 PVC screen. The screened portion of the well will be packed with #0 Morie Sand gravel pack or equivalent, sealed with hydrated bentonite, with the remaining annular space sealed with cement/bentoite grout. The riser will be constructed using 2 inch diameter Schedule 40 PVC with a flush mounted cover and lockable casing.

Each new monitoring well will be developed in accordance with NYSDEC protocol. During development field parameters (pH, conductivity, temperature, and turbidity) will be monitored. Development in each well will continue until the water is visibly free of turbidity. The purpose of the well development is to eliminate fine material, establish flow from the aquifer to the well, and allow for the collection of a representative groundwater sample. Purged water will be stored in 55-gallon drums pending proper disposal.

Following installation, PWGC will have the wells surveyed to determine spatial orientation and casing elevation. This information will be used to determine groundwater flow direction beneath the site. Following the survey, PWGC will collect groundwater elevation data, using an electronic interface probe, over a complete tidal cycle (12 hours). Groundwater elevation data will be collected from each well every ½ hour. Following completion of the well elevation survey, PWGC will prepare groundwater elevation contour maps representing high tide and low tide conditions. PWGC will utilize tidal charts to verify the tidal cycle.

Water elevation and groundwater flow information obtained from the survey will be used to finalize the location of the deep monitoring wells previously proposed at the site. Should the predominant direction of groundwater flow be to the east or southeast, the deep sample intervals will be installed adjacent to MW-5 and MW-6 as originally planned. Should groundwater flow be determined to vary, the deep wells be appropriately relocated. PWGC will confirm the locations with the NYSDEC prior to installation.

PWGC proposes to install two one inch monitoring wells within the same borehole. Each well will consist of 5 feet of screen. The deepest well will be screened from 100 feet to 95 feet below grade surface (bgs), while the mid-depth well will be screened from 50 feet to 45 feet bgs. These wells will be installed immediately adjacent to MW-5 and MW-6 to represent the originally proposed cluster wells with three distinct sampling intervals (MW-5 and MW-6) will represent the water table wells at these locations. If it is determined that the groundwater flow direction varies and alternate locations are chosen, then a third one inch monitoring well will be installed within the same borehole. This well will be installed with a 10 foot screened interval intersecting the water table and will represent water table conditions. The screened portion of each well will be packed with #0 Morie Sand gravel pack or equivalent and sealed with hydrated bentonite. The area between the intervals will be packed with sand equivalent to the natural formation. Prior to reaching the next shallower screened interval, additional hydrated bentonite will be used to complete a seal between sample intervals and the next screened interval gravel packed accordingly.

Following completion of well installation and development activities, a complete round of groundwater sampling will be performed. PWGC will perform groundwater sampling using USEPA Region II "Groundwater Sampling Procedure for Low Stress (Low Flow) Purging and Sampling, "March 1998. Groundwater samples will be collected and transferred to laboratory-supplied glassware and placed in a cooler containing ice for transport under proper chain of custody to an ELAP certified laboratory. Samples will be analyzed for VOC's by EPA Method 8260.

As previously indicated, PWGC proposes to perform the described work as a modification to ATC's approved December, 24, 2005 Work Plan. Therefore, the Community Air Monitoring Plan (CAMP), Waste Management Plan, Quality Assurance Plan, and Health and Safety Plans will be followed by PWGC during the implementation of the above work. **Appendix B** contains the revised emergency telephone numbers appropriate for PWGC.

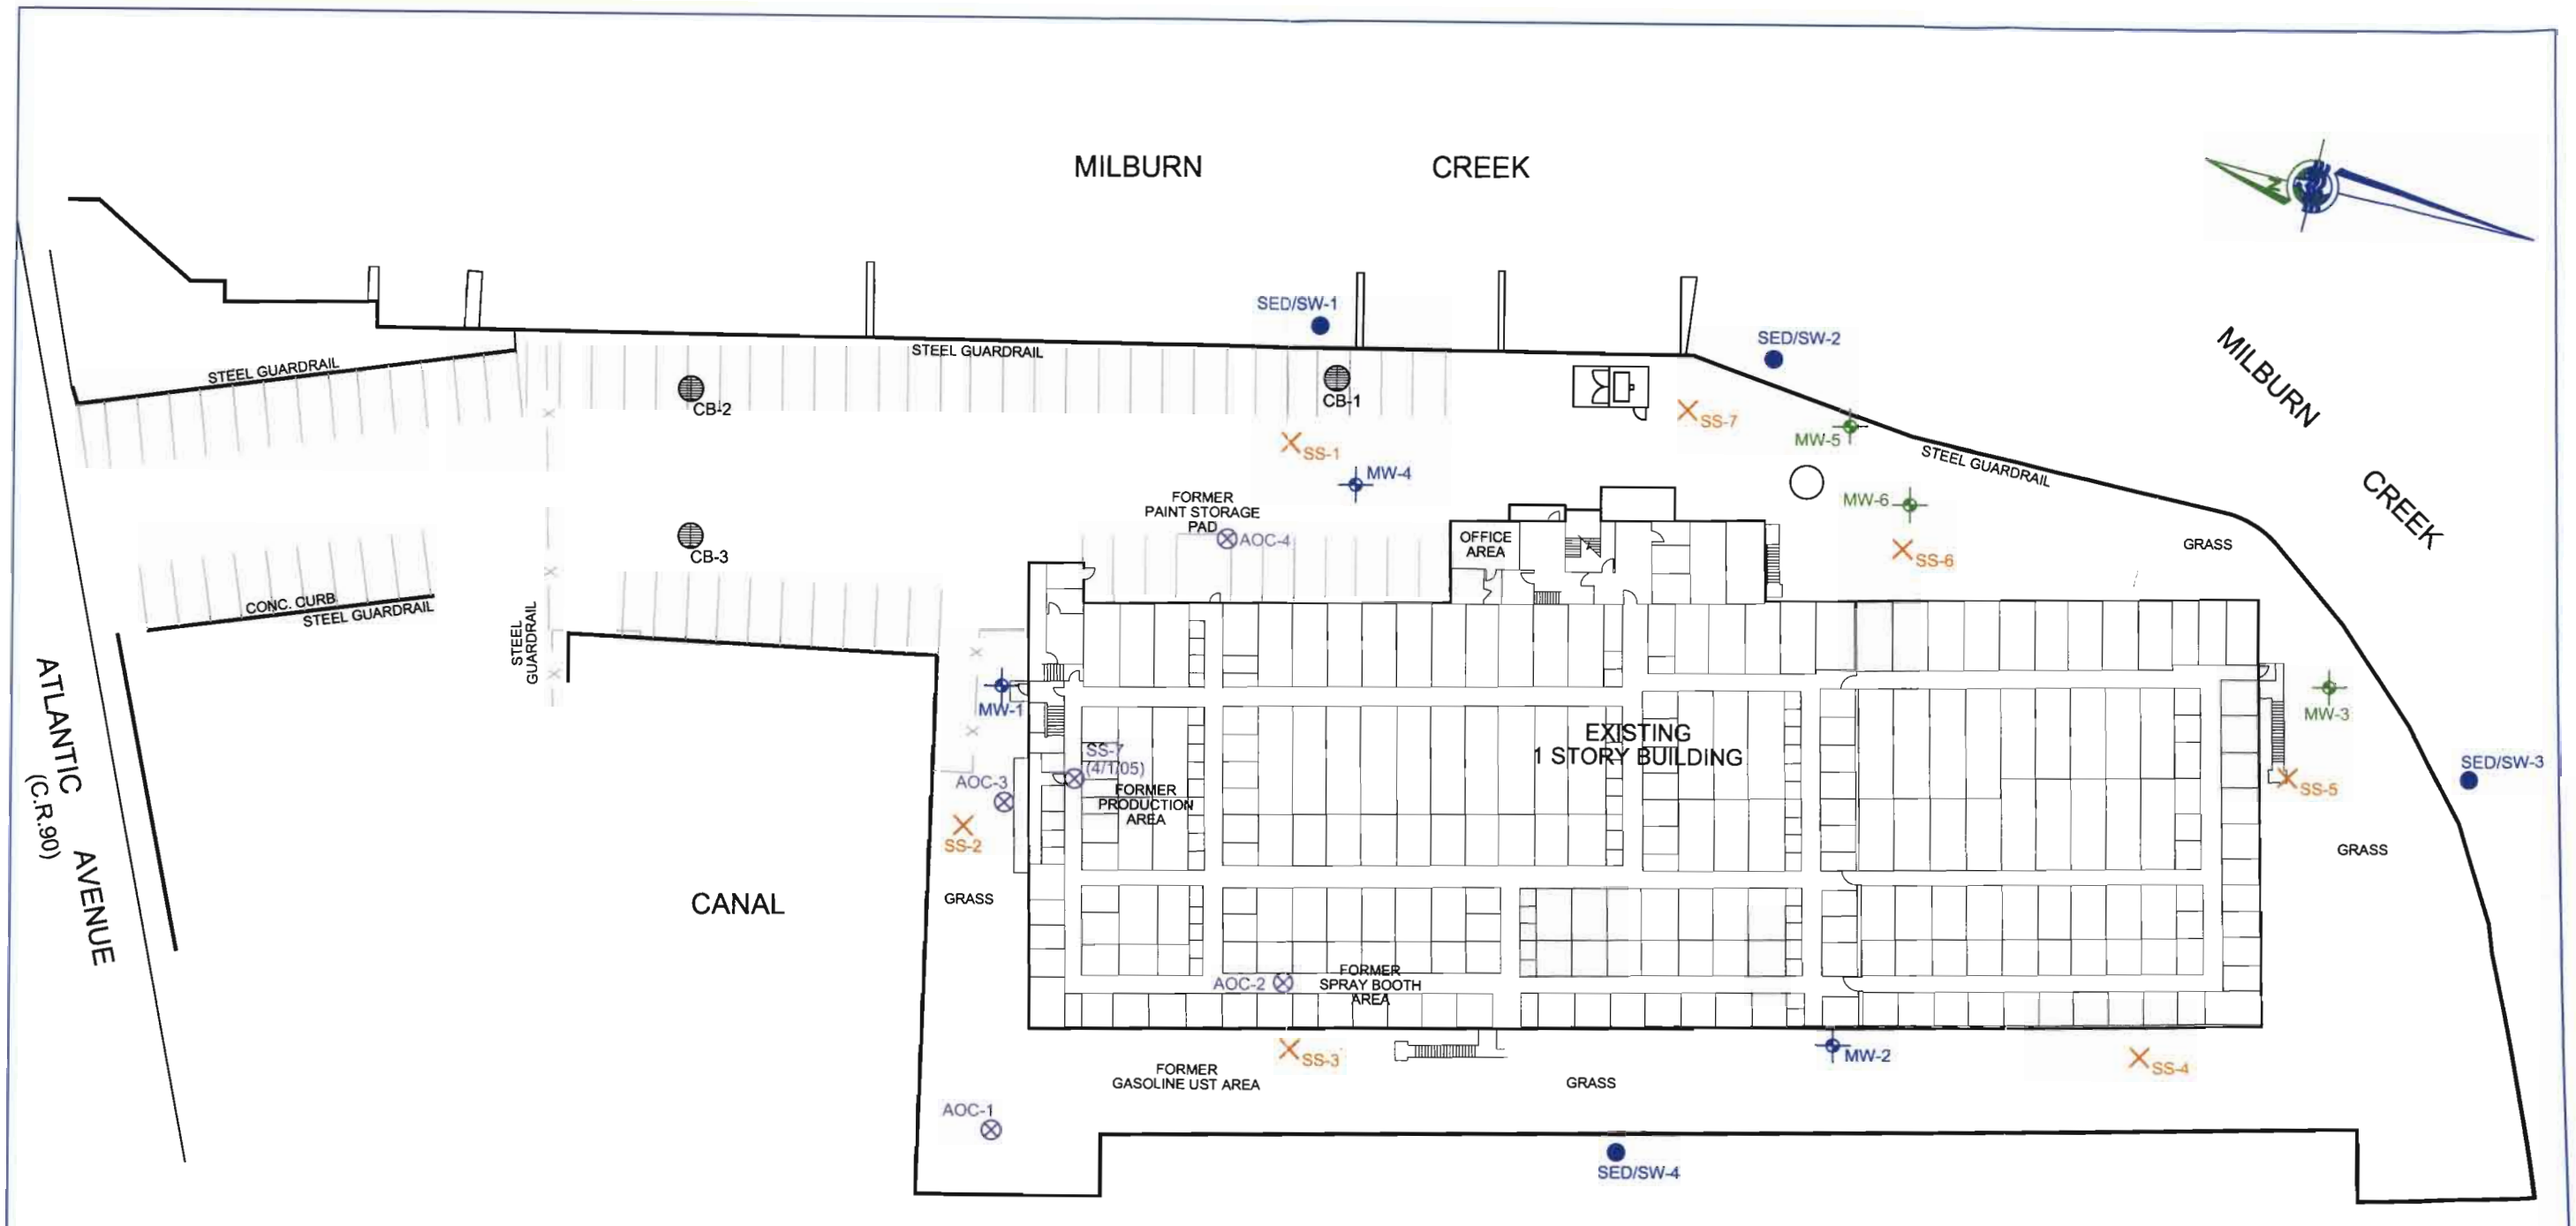

If you have any questions concerning the site or require further information, please don't hesitate to contact the office.

Very truly yours,
P.W. GROSSER CONSULTING, INC.
