### **INTRODUCTION AND SITE OVERVIEW**

#### **1.1 SUPPLEMENTAL REMEDIAL INVESTIGATION OBJECTIVES**

This Supplemental Remedial Investigation Report (SRIR) presents the results of supplemental remedial investigation (SRI) activities conducted by Parsons on behalf of Consolidated Edison Company of New York, Inc. (Con Edison) for the former Farrington Street Gas Works Site (the “Site”) located in Queens, New York (Figure 1). The SRI activities were conducted in accordance with the *Former Farrington Street Manufactured Gas Plant Site (Site No. V00560) Supplemental Remedial Investigation Work Plan* (SRIWP) (Parsons, 2018) approved by the New York State Department of Environmental Conservation (NYSDEC) on September 12, 2018.

The purpose of the SRI was to collect additional Site data to further characterize Site conditions in support of the evaluation of remedial alternatives for the Site. These additional Site data include the following:

- One (1) comprehensive groundwater sampling event, to include gauging, sampling, and analyses of all existing monitoring wells on Parcel 1, Parcel 2, in the vicinity of the Market Area of Parcel 1 (“Market Area”), and on adjacent properties to the southwest and east, to characterize current groundwater conditions at the Site with respect to dissolved phase MGP-related impacts;
- Performance of groundwater conductivity testing in existing groundwater monitoring wells, to characterize and model Site groundwater flow, both under current conditions and under potential post-remediation conditions;
- Performance of a tidal study in select monitoring wells;
- Collection and characterization of NAPL samples from select monitoring wells to assess NAPL migration behavior at the Site; and
- Performance of groundwater modeling to evaluate groundwater flow conditions under the following scenarios:
  - Existing site conditions;
  - Installation of subsurface barrier walls around Parcel 1, including the parking lot and Market Area, and around Parcel 2; and
  - Performance of in-situ stabilization/solidification (ISS) within the parking lot areas of Parcel 1 and Parcel 2 and installation of a subsurface barrier wall around the Market Area.

The potential remedial scenarios simulated during the groundwater modeling are further discussed in Sections 2.8 and 3.6.

## **1.2 REPORT ORGANIZATION**

The SRI was conducted by Parsons in November 2018. The field investigation activities are documented in this SRIR in the following sections and appendices:

- Section 1: Introduction and Site Overview
- Section 2: Supplemental Site Investigation Activities
- Section 3: Supplemental Site Investigation Results
- Section 4: Conclusions and Recommendations
- Appendix A: Groundwater Sampling Records
- Appendix B: Data Usability Summary Report
- Appendix C: Laboratory Analytical Report - Groundwater
- Appendix D: Laboratory Analytical Report - NAPL
- Appendix E: Hydraulic Conductivity Data
- Appendix F: Groundwater Model Report

## **1.3 SITE OVERVIEW**

The Site is located at 31-06 to 31-24 and 31-37 to 31-53 Farrington Street in Queens, New York. For the purposes of describing the Site, it has been divided into Parcels 1 and 2 ([Figure 2](#)). Field activities were conducted at each parcel as part of this SRI. The Site consists of approximately 6.17 acres spanning several city blocks, which contain several commercial properties, identified as Block 4406 Lots 9, 28, 30, 30R, 50 and 56, Block 4408 Lot 1R, and Block 4637 Lot 1. The Site is bordered to the north by the Whitestone Expressway Service Road, to the east by Farrington and Linden Streets, to the south by 32nd Avenue (formerly Myrtle Avenue), and to the west by Downing Street. The Site is located approximately 2,000 feet (ft) northeast of Flushing Creek, 1,200 feet southwest of Mill Creek, and 4,000 feet east of Flushing Bay. According to the New York City Department of City Planning, the Site and northwestern, western, southwestern, and southern abutting properties are zoned as M2-1 medium manufacturing districts (medium performance), and the abutting properties east of Farrington Street are zoned as M1-1 light manufacturing districts (high performance).

In Parcel 1, the Site presently contains a Stop and Shop grocery and pharmacy, various commercial stores, and a paved parking area. Parcel 2 consists of a mixed paved and gravel lot that is utilized as an equipment storage, trailer storage, and material lay down area.

## **1.4 SITE HISTORY**

Historical research was previously conducted and documented in the Site History Research Report (ENSR, 2003). Based on this report, the Site was owned and/or operated as a MGP by several different power companies between 1887 and the 1940s. Prior to the initiation of manufactured gas operations in 1887, the original Site boundaries included a smaller tract of land (the southwestern portion of Parcel 2), which was originally subdivided into smaller private

properties. Flushing Gas Light Company acquired portions of the original Site property between 1859 and 1901 and operated the MGP until 1889. Between 1901 and 1905, Newton and Flushing Gas Company, a subsidiary of the New York and Queens Gas Co., operated the Site and MGP, in addition to expanding the property boundaries into the northwestern portion of Parcel 2 in 1901. In 1905, the New York and Queens Company acquired the portion of the property previously owned by Flushing Gas Light Company and Newton and Flushing Gas Light Company. Between 1909 and 1921, New York and Queens Gas Company acquired and expanded the MGP into the eastern portions of Parcels 1 and 2. Con Edison purchased Parcel 3, to the east of Parcel 2, from New York and Queens Gas Company of February 26, 1924. Between 1924 and 1976, a three million cubic foot waterless gasholder and related equipment and structures occupied Parcel 3. After the MGP was retired in 1944, the holder in Parcel 3 was used for storage of gas that was produced at other Con Edison plants or purchased from other utilities. New York and Queens Gas Company merged with Con Edison on June 1, 1936, at which time Con Edison assumed operation of the MGP, then located in present-day Parcels 1, 2, and 3 (ENSR, 2003). [Figure 2](#) depicts the approximate locations of the former historic structures at the Site.

## 1.5 SUMMARY OF PREVIOUS INVESTIGATIONS

A Site Characterization of Parcel 2 was performed by Parsons in 2009, the scope of which included the installation of test pits, monitoring wells, and soil borings. A two-phase Remedial Investigation on Parcels 1 and 2 was conducted by Parsons between 2011 and 2015, the scope of which included the installation of soil boring and monitoring wells, as well as sampling of soils, soil gas, groundwater, and NAPL for forensic analysis. [Figure 3](#) depicts the soil boring and monitoring well locations installed at the Site as part of both the Site Characterization and Remedial Investigation field efforts. The collected data pertaining to Parcels 1 and 2 is presented in the *Site Characterization Report for the Former Farrington Street Gas Works Site* (Parsons, 2017a), and the *Remedial Investigation Report for the Former Farrington Street Gas Works Site* (Parsons, 2017b).

## SECTION 2

### SUPPLEMENTAL SITE INVESTIGATION ACTIVITIES

The following sections describe the field investigation activities conducted as part of the SRI. Parsons personnel mobilized to the Site and conducted field investigation activities between November 13th and November 30th, 2018. Field investigation activities were conducted in accordance with the NYSDEC approved SRIWP. Deviations from the SRIWP are detailed below. Field activities included groundwater gauging and sampling, sampling for non-aqueous phase liquid (NAPL), a tidal study, and hydraulic conductivity tests. Sampling locations are presented on [Figure 3](#). Following the SRI field activities, data were utilized in a numerical groundwater flow model to assess Site groundwater conditions and potential remedial alternative scenarios detailed in Section 2.8 and Section 3.6.

#### **2.1 SITE INSPECTION AND DEVIATIONS FROM WORK PLAN**

On November 9th and 12th, 2018, Parsons conducted a field reconnaissance at the Site to visually identify the locations of existing monitoring wells. During the field reconnaissance, it was determined that monitoring wells MW-13, MW-14, MW-16, MW-17, MW-18, MW-22, CMW-37, and CMW-39 had been covered and/or destroyed during pavement cover replacements and/or general Site activities, and therefore were not included in SRI field activities. As a result, alternative locations (MW-15, MW-19, MW-30, MW-41, and CMW-36) were selected for the tidal study and slug testing. Adjustments to sampling locations were made in consultation with Con Edison and the NYSDEC.

#### **2.2 GROUNDWATER SAMPLING**

On November 6<sup>th</sup>, November 14<sup>th</sup>, November 15<sup>th</sup>, and November 21<sup>st</sup>, 2018, groundwater samples were collected from twelve (12) groundwater monitoring wells (MW-15, MW-19, MW-20, MW-21, MW-25, MW-27, MW-28, MW-30, CMW-36, CMW-38, CMW-40, and MW-CSB-60). It should be noted that CMW-36 was sampled on November 6, 2018 as part of the groundwater sampling event conducted at the adjacent Holder site (Parcel 3) and, therefore, was sampled for emerging contaminants in addition to the laboratory analyses indicated below. The rest of the Site's monitoring wells were sampled during the dates indicated above. Prior to collecting groundwater samples, the depth to groundwater and the thickness of NAPL (if present) was measured in the monitoring wells using an electronic oil/water interface probe attached to a measuring tape accurate to 0.01 feet. [Table 1](#) provides a summary of groundwater level measurements, NAPL thicknesses, and elevations.

Groundwater sampling was performed in accordance with United States Environmental Protection Agency (USEPA) guidance *Low Stress Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells* (USEPA, 2010). Prior to purging, the headspace within each well was screened with a photoionization detector (PID) for total volatile organic carbon (VOC) compounds. Each well was purged using a peristaltic pump and low-flow purging techniques. Water quality parameters including temperature, conductivity, pH, dissolved oxygen, oxidation reduction potential (ORP), and turbidity were measured approximately every five minutes until three (3) consistent consecutive readings were collected.

Once stabilization was achieved, groundwater samples were collected using a peristaltic pump and dedicated tubing. Water quality parameter measurements and observations recorded during sampling activities are documented on the groundwater sampling records provided in [Appendix A](#). Groundwater samples were submitted for laboratory analysis by Test America of Edison, New Jersey, a NYSDOH approved Environmental Laboratory Analysis Program (ELAP) laboratory certified for analyses using Analytical Services Protocol (ASP), for analysis of volatile organic compounds (VOCs) via Method 8260C, semi-volatile organic compounds (SVOCs) via Method 8270D, cyanide via Method 9012B, and TAL metals via Methods 6010D and 7470A. Non-dedicated sampling equipment (e.g., oil/water interface probe) were decontaminated between sampling locations. Decontamination water was placed in 55-gallon drums and handled as described in Section 2.6.

### **2.3 NAPL SAMPLING**

Three (3) samples of NAPL were collected from monitoring wells MW-15, MW-19, and CMW-38. NAPL samples were submitted to PTS Laboratories of Houston, Texas for the laboratory analysis of density, viscosity, and interfacial tension.

Results pertaining to NAPL sampling and interpretation of Site NAPL mobility are summarized in Section 3.3.

### **2.4 HYDRAULIC CONDUCTIVITY TESTS**

To estimate hydraulic conductivity at the Site, in-situ hydraulic conductivity tests (slug tests) were performed at twelve (12) wells (MW-15, MW-19, MW-20, MW-21, MW-25, MW-27, MW-28, MW-30, CMW-36, CMW-38, CMW-40, and MW-CSB-60).

The slug tests were conducted by placing a Mini TROLL-Pro™ pressure transducer/data logger into the well and allowing the water level to equilibrate. A slug of known volume was then lowered into the well to displace the water. The slug was constructed of steel, filled with sand, capped, and sealed. Upon lowering the slug approximately 2-feet past the top of the water table within the well, a falling head test commenced. The data logger then continuously recorded the water level at 1 second intervals as it decreased during the falling head test. After equilibrium was reached, the slug was withdrawn, and the water level was recorded again at 1 second intervals as it rebounded during the rising head test.

Upon completion of the hydraulic conductivity tests, the data was analyzed using the Bouwer-Rice and Hvorslev methods to derive a value for hydraulic conductivity. Hydraulic conductivity test results are presented in Section 3.4.

### **2.5 TIDAL STUDY**

Based on the Site's proximity to Flushing Bay and the East River, a tidal study was conducted within on-site monitoring wells. The study provided data to evaluate the effects that tidal fluctuations have on groundwater elevations and flow directions beneath the Site, and whether these may have an effect on the migration of groundwater and potential impacts identified on-site.

Pressure transducers (MiniTROLL-ProTM) with automatic dataloggers were installed in each well to record groundwater levels every minute over a 10-day period. Monitoring well covers were secured, and a VOC free sealant was applied to the rim to ensure no surface waters would enter

the well during the course of study. Transducers were installed in ten (10) wells (MW-15, MW-19, MW-21, MW-25, MW-27, MW-30, CMW-36, MW-40, MW-41, and MW-CSB-60). Tidal data was downloaded from the transducers following retrieval and converted to elevation values. Tidal study results are presented in Section 3.4.

## **2.6 MANAGEMENT OF INVESTIGATION-DERIVED WASTE**

Investigation-derived wastes (IDW) generated during Site investigation activities were containerized prior to disposal. Purge water and personal protective equipment (PPE) were placed in 55-gallon Department of Transportation (DOT) approved drums which were labeled appropriately. The drums were staged in a designated secure waste storage area on-site, per the guidance from on-site facility representatives, to permit proper characterization and off-site transportation and disposal. Following characterization, the drums were transported off-site by Parsons subcontractor, Clean Earth of North Jersey, Inc., and disposed of at Clean Earth of Kearny, New Jersey (a RCRA Part B permitted Transfer, Storage, and Disposal Facility (TSDF)).

## **2.7 DATA VALIDATION AND REPORTING**

Laboratory analyses of groundwater samples were conducted in accordance with USEPA SW-846 methods and the standard deliverable format by a NYSDOH ELAP approved laboratory certified for analysis using the most recent Analytical Services Protocol (ASP).

QA/QC procedures required by the SW-846 methods were followed, including initial and continuing instrument calibrations, standard compound spikes, surrogate compound spikes, and analysis of other samples (blanks, laboratory control samples, matrix spikes/matrix spike duplicates, etc.). The laboratory provided sample bottles, which were pre-cleaned and preserved in accordance with the SW-846 methods. NYSDEC ASP holding times were adhered to. Note that the SW-846 methods are incorporated into the NYSDEC ASP. Where there are differences in the SW-846 and NYSDEC ASP requirements, the NYSDEC ASP took precedence.

Data validation was performed in accordance with USEPA Region II standard operating procedures (SOPs) for organic and inorganic data review. These validation guidelines are regional modifications to the National Functional Guidelines for organic and inorganic data review (USEPA, 1999). Validation included the following:

- Verification of 100% of all quality control (QC) sample results (both qualitative and quantitative);
- Verification of the identification of 100% of all sample results (both positive hits and non-detects);
- Re-calculation of 10% of all investigative sample results; and
- Preparation of a Data Usability Summary Report (DUSR).

The DUSR is presented in [Appendix B](#).

## **2.8 GROUNDWATER MODELING**

Groundwater flow modeling was used to provide hydrogeologic support for remedial improvement scenarios related to evaluating potential Site remedial alternatives. The purpose of the groundwater modeling was to quantify groundwater flow conditions, improve estimates of

hydraulic conductivity at the Site, and to develop predictive scenarios to support remedial alternative evaluations.

Utilizing data collected during the SRI and previous investigations, a numerical finite difference groundwater model was developed, constructed, and calibrated (with sensitivity testing) to simulate groundwater flow conditions and identify groundwater particle paths, and associated velocities, for the Site. The purpose of the model is to qualitatively and quantitatively evaluate groundwater flow at the Site, with specific relevance to the remedial scenarios of subsurface barrier wall containment and ISS. The steady state model was calibrated to one set of synoptic water levels using existing and new groundwater hydraulic information (transmissivity, regional gradients, aquifer architecture, potential for tidal influences, etc. collected during SRI field activities).

The preliminary groundwater modeling addressed three potential remedial scenarios at the Site:

- Scenario 1 – simulated existing subsurface conditions at the Site;
- Scenario 2 – simulated subsurface conditions at the Site should the remedy include perimeter containment barriers at Parcels 1 and 2, and in the vicinity of the Market Area; and
- Scenario 3 – simulated subsurface conditions at the Site should the remedy include ISS at Parcels 1 and 2 and a perimeter containment barrier in the vicinity of the Market Area.

Groundwater modeling results are discussed in Section 3.6.

## SECTION 3

### SUPPLEMENTAL SITE INVESTIGATION RESULTS

This section presents the results of the SRI. The November 2018 groundwater elevations were used to produce a Site groundwater contour map ([Figure 4](#)). Analytical results for groundwater have been summarized in [Table 2](#) and on [Figure 5](#). Hydraulic conductivity results are summarized in [Table 3](#). Results pertaining to NAPL characterization are presented on [Figure 6](#) through [Figure 8](#). Results pertaining to an evaluation of tidal influence at the Site are presented on [Figure 9](#). Results pertaining to groundwater modeling are presented on [Figure 10](#) through [Figure 13](#).

#### 3.1 SITE HYDROGEOLOGY

A site-wide gauging event was conducted on November 13th, 2018 in groundwater monitoring wells present at the Site. In addition, monitoring well gauging was conducted at the adjacent former gas holder station site (Parcel 3), and those groundwater levels were included in analyzing groundwater flow conditions at the Site. Depth to groundwater was gauged in nineteen (19) monitoring wells. Groundwater was encountered at depths ranging from 3.49 feet to 13.91 feet bgs, and at elevations ranging from 4.56 to -0.85 feet above mean sea level (AMSL). Groundwater levels, NAPL measurements (if present), and corresponding elevations pertaining to this gauging event are summarized on [Table 1](#). Groundwater contours based on the November 2018 gauging event indicate a groundwater high in the northwestern portion of the Site (Parcel 1), and a groundwater low in the southeastern part of the Site, indicating a general flow direction to the southeast. A localized groundwater low is present on the southern edge of the Market Area (MW-19).

#### 3.2 GROUNDWATER SAMPLING RESULTS

On November 6th, November 14th, November 15th, and November 21st, 2018, twelve (12) groundwater samples were collected during SRI activities and submitted to Test America for analysis of VOCs via Method 8260C, SVOCs via Method 8270D, cyanide via Method 9012B, and TAL metals via Methods 6010D and 7470A. For evaluation purposes, analytical results were compared with Ambient Water Quality Standards (AWQS) and guidance values contained in NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 (NYSDEC, 2010). These standards and guidance values are protective of groundwater quality assuming that groundwater is used as a source of drinking water. That assumption is not applicable to the Site because groundwater is not used now, nor will it be used in the future, as a source of drinking water. Accordingly, the use of Class GA standards and guidance values for comparison to Site groundwater data is conservative. Field measurements and observations as well as analytical results pertaining to groundwater sampling are summarized below. Groundwater analytical results are summarized in [Table 2](#) and presented on [Figure 5](#), and the laboratory analytical report is presented in [Appendix C](#).

## **Field Measurements**

Twelve (12) groundwater monitoring wells (MW-15, MW-19, MW-20, MW-21, MW-25, MW-27, MW-28, MW-30, CMW-36, CMW-38, CMW-40, and MW-CSB-60) were sampled upon reaching stabilization of water quality parameter and turbidity levels below 50 NTU. Measurements collected during groundwater sampling activities are presented in [Appendix A](#).

## **NAPL Observations**

During monitoring well gauging, NAPL was observed in monitoring wells MW-15, MW-19, and CMW-38. Observed NAPL thicknesses during the November 13th, 2018 gauging event were 0.14 feet in MW-15 and 0.43 feet in MW-19. The NAPL thickness in CMW-38 was observed to be 0.47 feet on November 14, 2018. On November 21st, 2018, a NAPL drawdown test was performed in CMW-38 and is further described in Section 3.3. Approximately 200 milliliters of NAPL were removed from the well and levels were subsequently monitored for a period of 3 hours, at which time only trace amounts were measurable within the well.

## **VOC Analytical Results**

A total of twelve (12) VOCs were detected at least once in groundwater samples collected during SRI sampling activities. Of these, five (5) VOCs (benzene, ethylbenzene, isopropylbenzene, tetrachloroethylene, and total xylenes) were detected at concentrations in exceedance of their respective Class GA GWQSSs and guidance values. Tetrachloroethylene (PCE) is not an MGP-related constituent of concern. Total VOC concentrations ranged from non-detect to 6,329 µg/L. Maximum VOC concentrations were detected in the sample collected from MW-30. Based on current and historical sampling data, total VOC concentrations are observed to have decreased over time in monitoring wells MW-15, MW-16, MW-19, MW-21, MW-25, CMW-36, and CMW-38, and concentrations are observed to have increased in monitoring wells MW-20, MW-30, and CMW-40. Laboratory analytical data is summarized in [Table 2](#) and presented on [Figure 5](#).

## **SVOC Analytical Results**

A total of eighteen (18) SVOCs were detected in groundwater samples collected during SRI sampling activities. Of these, six (6) SVOCs (acenaphthene, benzo(a)anthracene, benzo(b)fluoranthene, chrysene, naphthalene, and phenol) were detected in excess of their respective Class GA GWQSSs and guidance values. Total SVOC concentrations ranged from non-detect to 638.3 µg/L. Maximum SVOC concentrations were detected in the sample collected from MW-19. Generally, total SVOC concentrations are observed to be decreasing over time in all monitoring wells sampled during the 2018 SRI activities. Laboratory analytical data is summarized in [Table 2](#) and presented on [Figure 5](#).

## **Inorganic Analytical Results**

A total of nineteen (19) inorganic constituents were detected at least once in groundwater samples collected during SRI sampling activities. Of these, six (6) inorganic constituents (antimony, barium, iron, magnesium, manganese, and sodium) were detected in excess of their respective Class GW GWQSSs and guidance values. Results for cyanide indicated all detected

concentrations were below the GWQSSs and guidance values. Laboratory analytical data is summarized in [Table 2](#).

### 3.3 NAPL SAMPLING RESULTS

Samples of light non-aqueous phase liquid (LNAPL) were collected at MW-15, MW-19 and CMW-38 and analyzed for physical properties (density, viscosity, and interfacial tension). Analytical results from each sample were fairly consistent and represented a typical MGP-type LNAPL. Physical properties were also indicative of LNAPL, which support field observations. The full laboratory analytical report pertaining to NAPL sampling is presented in [Appendix D](#).

The specific gravity of each NAPL sample ranged from approximately 0.89 to 0.92 (unitless) from 70 to 130 degrees F. The projected specific gravity in-situ (assuming 45 degrees Fahrenheit) ranged from approximately 0.905 to 0.902. Since these values are less than 1, this further confirms that the NAPL sampled is a LNAPL ([Figure 6](#)).

The measured viscosity varied from approximately 3.44 to 19.05 centistokes (3.02 to 17.50 centipoise) at 70 to 130 degrees Fahrenheit. The estimated in-situ viscosity is approximately 12 to 30 centistokes, when projecting this trend to 45 degrees Fahrenheit ([Figure 7](#)). As further discussed in the section below, NAPL mobility is inversely proportional to viscosity (as viscosity increases, fluid mobility decreases, proportionally). Therefore, the elevated viscosities observed in NAPL collected from the Site suggest that NAPL mobility is low.

### LNAPL Transmissivity Testing

An attempt was made to conduct a LNAPL transmissivity test at CMW-38 by removing 200 milliliters of NAPL from the monitoring well and subsequently collecting NAPL thickness measurements for a period of three (3) hours. Volumes of NAPL observed re-emerging within CMW-38 were insufficient to effectively measure NAPL thickness. Although no NAPL was recovered in the 3 hours following removal, a qualitative comparison was made to type curves provided in American Petroleum Institute (API) Publication 4762 (API, 2016). Results indicate the NAPL transmissivity is very low and likely lower than 0.005 ft<sup>2</sup>/day.

Based on the transmissivity testing from November 2018 when no NAPL was observed recharging in CMW-38 for three (3) hours following removal, it can qualitatively be said that the NAPL transmissivity is low. When comparing the Type curves ([Figure 8](#)), it can be noted that the NAPL transmissivity is likely less than 0.005 ft<sup>2</sup>/day, indicating there is little to no NAPL migration potential.

Groundwater and NAPL migrate by means of Darcy's law and fluid conductivity. Fluid Conductivity, whether it is water or NAPL, is related to viscosity as shown below:

$$K = \frac{k\rho g}{\mu}$$

Where:

K= fluid conductivity (hydraulic or free phase)

$k$  = intrinsic permeability (properties of the soil)

$\rho$  = fluid density

$g$  = gravitational acceleration (constant)

$\mu$  = dynamic viscosity of the fluid

Knowing that fluid conductivity is inversely related to dynamic viscosity (above), it can be demonstrated that as viscosity increases the fluid mobility decreases, proportionally. [Figure 7](#) provides the field data from the NAPL and water samples from the Site, with extrapolation to groundwater temperatures. This plot of measured data demonstrated that the NAPL viscosity is approximately 7 to 15 times more viscous than groundwater at 45 degrees Fahrenheit, which suggests the NAPL transmissivity is at least 7 to 15 times lower than the hydraulic conductivity. Groundwater modeling, further described in Section 3.6, suggests that transmissivity in the vicinity of the Market Area and toward the east is fairly low. When considering the reduction of flow related to viscosity (without considering saturation, low NAPL head, and no observed NAPL migration), it can be concluded that the NAPL mobility is negligible.

### **LNAPL Body Stability and Declining Percent Saturation**

LNAPL stability at the Site has been maintained through geological integrity of the soils and long-term nature of the historic site. Site observations which indicate LNAPL stability include:

- Lack of observed LNAPL at downgradient locations;
- Insignificant amount of LNAPL accumulation in wells;
- Low transmissivity of the LNAPL;
- Low hydraulic gradient observed from the Market Area and towards the east;
- Low simulated groundwater velocity;
- Groundwater concentrations over time trending downward; and
- Historical nature of the release.

The release of free product ended after decommissioning of the former MGP facility, which occurred in 1944. As such, the NAPL is assumed to be weathered, aged, and has decreased in migration potential. Furthermore, it is likely that most of the NAPL transport occurred during the previous active release period when there was a much higher hydraulic head, creating a driving force for NAPL migration. In cases of historical industrial sites where production has been discontinued for decades, the majority of NAPL migration had occurred during the operation of the facility when an active NAPL head was present. The NAPL head, and therefore NAPL migration, is significantly reduced following a prolonged discontinuance of former facility operations. Furthermore, the NAPL collected and analyzed is of relatively high viscosity, indicating it has further aged and reduced in mobility potential.

### **3.4 HYDRAULIC CONDUCTIVITY TESTING**

Falling and rising head slug tests were completed at twelve (12) locations to quantify the hydraulic conductivity in various areas of the Site. In all cases, the rising head test was analyzed since it is more appropriate for wells screened across the water table. In one case (MW-21) the test was duplicated due to poor results from the initial test. After the recovery data was reduced and organized, the curve matching analysis was completed within Aquifer Test Pro V2015.1. Both Hvorslev (1951) and Bower and Rice Techniques were used to analyze the results such that comparisons on mathematical methodology can be drawn and bracket the potential range resulting from test assumptions. This provides a more technically robust analysis.

Curve matching analyses for each test is provided in [Appendix E](#), and [Table 3](#) provides a summary of the tests in addition to screen intervals. The resulting hydraulic conductivities varied from 0.22 to 224 feet per day, however, as is typical when comparing slug tests for a group of locations the range of results is exaggerated by only a few samples. The geomean from the Hvorslev analyses was 15.6 feet per day, and the geomean from the Bower and Rice was 11.8 feet per day. Spatial distribution of the slug tests did not indicate a strong relationship between space and hydraulic conductivity, however there is some indication that along Farrington Street, southeast of the Market Area, the soils may have higher hydraulic conductivity. Furthermore, the stochastic nature of slug testing and relatively small area influenced by the slug limit the amount of defendable spatial interpretation which can be accomplished on these data.

Hydraulic conductivity tests are summarized on [Table 3](#), and presented in [Appendix E](#).

### **3.5 TIDAL STUDY RESULTS**

Based on the Site's proximity to the Flushing Bay and the East River, a tidal study was conducted within ten (10) groundwater monitoring wells. The tidal study allowed for evaluating the effects that tidal fluctuations may have on groundwater elevations and flow directions beneath the Site. Furthermore, the tidal study (being transient in nature) allowed for determination of other diurnal changes and effect from precipitation. [Figure 9](#) displays the hydrographs from each well and the nearby College Point Flushing bay surface water elevation. The plot demonstrates there is no tidal effect from the nearby changing sea levels in the bay.

As a compliment to the transient data, the measurement period overlapped across several precipitation events. This allowed for observation and measurement of increases of water level change as the result of precipitation. There was an increase related to the precipitation events and the data provided important information related to relevant and absolute change in groundwater elevation as the result of precipitation.

### **3.6 GROUNDWATER MODELING**

[Figures 10](#) through [Figure 12](#) demonstrate the results from each modeled scenario and are summarized here. [Figure 13](#) provides a comparison of groundwater velocities.

The model was calibrated using regional information (surface water bodies), field data (hydraulic head measurements), and inverse modeling processes (software algorithms). Once calibrated objectives were met and the model produced results consistent with groundwater flow results, predictive scenarios were developed. Regional recharge to the aquifer was estimated at a low value of 1.16 inches per year, but slightly above published value of 0.89 inches per year. Due

to the retail building in the Market Area, the recharge under the building was reduced to 0.22 inches per year to support calibration. It was observed that because of the steady state simulation, and the idealized nature of the model, elevated water mounding occurred in Parcel 1. Therefore, predictive model runs were established with calibrated recharge and zero recharge for the three parcels. While surface improvements and engineering design can further reduce recharge in parcels, it remains unknown if recharge could be reduced to zero. As such, for the varying recharge predictive scenarios, the calibrated recharge and zero recharge simulations provide a range of groundwater velocities and it is likely that the actual velocity would be within this range.

Existing Conditions:

- The groundwater flow under existing conditions travels to the southeast off of a slightly elevated groundwater mound, on top of the clay observed under the parking lot area and northwest of the Site; and
- Based on the calibrated model, the existing groundwater velocity through the Site is low to moderate, varying from approximately 10 to 54 feet per year.

Subsurface Barrier Wall:

- In the parking lot area of Parcel 1, the simulated particle velocities decreased to negligible rates of approximately 3 feet per year using calibrated recharge, and 0.06 feet per year assuming no recharge to the water table. This is due to the result of the low permeability underlying clay and the typical hydraulic conductivity of subsurface barrier walls (e.g.,  $10^{-7}$  centimeters per second);
- In the Market Area, the simulated particle velocities decreased due to groundwater being diverted around this area. On the western side of the Market Area, the simulated average particle velocity is reduced to 6 feet per year due to the decrease in head that would be caused by the subsurface barrier walls nearly surrounding the parcel. Near the east side of the Site, the average linear velocity would be approximately 28 feet per year; and
- In the southern area (Parcel 2) of the Site, simulated particle velocities decreased to approximately 3 feet per year due to the lower recharge and low vertical hydraulic conductivity of the sand in this unit (0.32 feet per day to 2 feet per day).

ISS:

- Under this remedial scenario, ISS would be performed in the parking lot area of Parcel 1, and within Parcel 2, as noted on [Figure 12](#). No particles were tracked from within the ISS areas, as it was assumed that the ISS would eliminate flux; and
- In the Market Area, the groundwater flow was reduced to similar rates as the subsurface barrier wall alternative. On the western side of the Market Area, the average linear velocity was reduced to 7 feet per year. Closer to the east side of the Site the average linear velocity was also approximately 28 feet per year.

Overall, the results of the groundwater modeling indicate that there is minimal difference between a subsurface barrier wall remedy compared to an ISS remedy for the Site in terms of

overall effectiveness in reducing the potential for contaminant migration off-site. In both scenarios, groundwater flow in the parking lot area of Parcel 1 is fully contained, and groundwater flow in the majority of the Market Area and Parcel 2 is reduced to less than 10 feet per year. Furthermore, groundwater flowing from each parcel follows a path onto the adjacent Holder site which is currently under natural attenuation monitoring and may continue to be monitored for impacts from the Site. Lastly, groundwater flow in the eastern portion of the Market Area can be further reduced should a subsurface barrier wall be extended or added in this area of the Site.

The full groundwater modeling report is presented in [Appendix F](#).

## **SECTION 4**

### **CONCLUSIONS AND RECOMMENDATIONS**

The SRI was conducted between November 13th, 2018 and November 30th, 2018 and entailed the collection and analysis of twelve (12) groundwater samples, three (3) NAPL samples, hydrogeologic testing via slug tests in twelve (12) wells, and a 10-day tidal study in ten (10) wells. Following SRI field activities, hydrogeologic data were combined with subsurface data generated during previous investigations to develop a groundwater model of the Site. The groundwater model was utilized to assess groundwater flow conditions under three (3) scenarios: existing Site conditions, a Site remedy consisting of a subsurface barrier wall, and a Site remedy consisting of ISS.

#### **4.1 SUMMARY OF FINDINGS**

The findings of the SRI and groundwater modeling are summarized below.

- The groundwater table at the Site is observed at depths ranging from 3 to 14 feet below grade, and at elevations ranging from -1.0 to 5.0 feet AMSL;
- Site groundwater levels do not appear to be greatly influenced by tidal cycles in the adjacent Flushing Bay and East River;
- No VOC exceedances of AWQSs and guidance values were observed in monitoring wells MW-21, MW-27, and MW-CSB-60 during SRI sampling activities. Only one VOC, tetrachloroethylene (PCE), was detected in excess of its Class GW GWQS and guidance value in MW-28. PCE is not a MGP-related constituent of concern;
- Total VOC concentrations are decreasing over time in monitoring wells MW-15, MW-16, MW-19, MW-21, MW-25, CMW-36, and CMW-38. Based on the 2018 sampling data, VOC concentrations are observed to have increased in monitoring wells MW-20, MW-30, and CMW-40;
- No SVOC exceedances of AWQSs and guidance values were observed in monitoring wells MW-21, MW-25, MW-27, MW-28, CMW-36, and MW-CSB-60;
- Total SVOC concentrations are decreasing over time in all monitoring wells sampled during the 2018 SRI activities;
- LNAPL collected from the Site during the SRI field activities is observed to be of high viscosity, indicating that it is aged and weathered, and has reduced mobility;
- Based on the results of hydraulic conductivity testing via slug tests, resulting hydraulic conductivities varied from 0.22 to 224 feet per day;
- Spatial distribution of the slug tests did not indicate a strong relationship between space and hydraulic conductivity, however there is some indication that along Farrington Street, southeast of the Market Area, the soils may have higher hydraulic conductivity;
- Based on the calibrated groundwater model, the existing groundwater velocity through the Site is low to moderate varying from approximately 10 to 54 feet per year;

- Under the modelled barrier wall scenario, particle velocities in the parking lot area of Parcel 1 decrease to negligible groundwater velocities of 3 feet per year using calibrated recharge, and 0.06 feet per year with no recharge to the water table. Within the Market Area the groundwater flow is reduced due to groundwater being diverted around this area. Groundwater velocities in Parcel 2 are reduced to approximately 3 feet per year due to the lower recharge and low vertical hydraulic conductivity;
- Under the modelled ISS scenario, the groundwater flow is reduced to similar rates as the barrier wall option within the Market Area. On the western side of the Market Area, the average linear velocity is reduced to 7 feet per year. Closer to the east side of the Site the average linear velocity was approximately 20 feet per year; and
- Under the modelled ISS scenario, it is assumed that the groundwater flow within the stabilized areas in the parking lot area of Parcel 1 and Parcel 2 would be reduced to negligible values following stabilization.

## 4.2 CONCLUSIONS

As stated in Section 1, the purpose of this SRI was to obtain additional hydrogeologic and NAPL data in the form of groundwater analytical data, groundwater conductivity data, NAPL transmissivity and physical property data, and tidal influence data to support the potential remedial alternative analysis for the Site.

Based upon data collected during the SRI activities, while SVOC concentrations appear to have increased since the 2015 sampling event along the eastern portion of the Site, SVOC concentrations have generally decreased across the entirety of the Site. Analytical results for the three (3) NAPL samples collected were fairly consistent and indicative of a typical MGP-type LNAPL.

Hydraulic conductivity results from the slug tests conducted did not indicate a strong relationship between space and hydraulic conductivity, however there is some indication that along Farrington Street, southeast of the Market Area, the soils may have higher hydraulic conductivity. The tidal study conducted as part of the SRI indicates that there is no tidal effect from the nearby surface water bodies on the groundwater flow beneath the Site.

Groundwater modelling was utilized to assess three potential Site scenarios:

- Under existing conditions, groundwater velocities are low to moderate, ranging from 10 to 54 feet per year;
- Under the subsurface barrier wall scenario, velocities in the parking lot area of Parcel 1 would be reduced to a negligible rate of approximately 3 feet per year using a calibrated recharge, and 0.06 feet per year when assuming no recharge. Flow velocities would also be reduced within the Market Area as flow is diverted around this area. Groundwater flow in Parcel 2 is reduced to approximately 3 feet per year due to low recharge and low vertical hydraulic conductivity; and
- Under the ISS scenario, groundwater flow velocities would also be reduced to rates similar to the subsurface barrier wall remedial alternative.

The following list of remedial alternatives will be evaluated as part of the Alternatives Analysis Report (AAR) for the Site:

- Excavation and off-site disposal and treatment of MGP impacted soils;
- Installation of a barrier wall and/or cap for containment of MGP impacts;
- NAPL recovery system;
- Site Management Plan;
- Institutional controls; and
- ISS of MGP impacted soils

These remedial alternatives were proposed for evaluation in the AAR for the Site in an October 19, 2017 email correspondence from Con Edison to the NYSDEC. The NYSDEC concurred with these proposed screening remedial alternatives for the Site in a November 15, 2017 email correspondence.

Based on the SRI data and the subsequent groundwater modeling results, it appears that ISS and a subsurface barrier wall system would be equally effective in containing MGP impacts at the Site. It should be noted though that both of these alternatives would be difficult, if not unfeasible to implement at Parcel 1, given its current use as an active shopping center.

The AAR will include a comparative analysis of the above remedial alternatives based on established evaluation criteria and remedial action objectives thus providing justification for the proposed alternative.

Notes:

- 1) Groundwater gauging performed on November 13, 2018.
- 2) Monitoring Wells MW-13, MW-14, MW-16, MW-17, MW-18, CMW-22, CMW-37, and CMW-39 (located at the Former MGP Site) were found to be missing or destroyed due to Site use at the time of gauging.
- 3) Monitoring Well MW-25 was inaccessible at the time of gauging due to ponding storm water.
- 4) Monitoring Well CMW-38 was inaccessible at the time of gauging due to new concrete preventing the well cover from being opened.
- 5) Following removal of concrete obstructing CMW-38 well cover, only NAPL thickness measurements obtained.

#### LEGEND:

- GROUNDWATER MONITORING WELL GAUGED IN NOVEMBER 2018
- INFERRED GROUNDWATER CONTOUR
- GROUNDWATER CONTOURS
- (1.1') NOVEMBER 2018 GROUNDWATER ELEVATIONS (FT AMSL)

#### NOTES:

1. GROUNDWATER ELEVATIONS IN FEET AMSL
2. GROUNDWATER ELEVATION DATA COLLECTED 11/13/2018
3. LNAPL WAS MEASURED IN MONITORING WELLS MW-15 AND MW-19 DURING THE NOVEMBER 2018 GAUGING EVENT. A SPECIFIC GRAVITY OF 0.93 WAS USED TO CALCULATE A CORRECTION FACTOR THAT WAS USED TO ADJUST GROUNDWATER ELEVATIONS IN THESE WELLS.
4. THE FOLLOWING MONITORING WELLS COULD NOT BE LOCATED OR WERE DAMAGED AT THE TIME OF GAUGING: MW-13, MW-14, MW-16, MW-17, MW-18, MW-22, CMW-37, AND CMW-39.

## NOTES

- ALL CONCENTRATIONS ARE IN PARTS PER BILLION (ppb).
- SHADED VALUES EXCEED NYSDEC GROUNDWATER QUALITY STANDARDS OR GUIDANCE VALUES (TOGS 1.1.1).
- NO VOCs OR SVOCs WERE DETECTED ABOVE QUALITY STANDARDS OR GUIDANCE VALUES IN CMW-36, CMW-39, MW-27, MW-41, OR MW-CSB-60.
- ONLY COMPOUNDS THAT EXCEED QUALITY STANDARDS OR GUIDANCE VALUES, FOR A GIVEN LOCATION, ARE SHOWN.
- ND INDICATES COMPOUND WAS NOT DETECTED.
- "J" INDICATES AN ESTIMATED CONCENTRATION.

## LIST OF ATTACHMENTS

### **ATTACHMENT A VALIDATED LABORATORY DATA**

# **SECTION 1**

## **DATA USABILITY SUMMARY**

Groundwater samples were collected from the Consolidated Edison Farrington Street MGP site on November 14, 2018 and November 21, 2018. Analytical results from these samples were validated and reviewed by Parsons for usability with respect to the following requirements:

- Work Plan,
- Analytical methodologies, and
- USEPA Region II Standard Operating Procedures (SOPs).

The analytical laboratory for this project was Test America Laboratories (TAL) in Edison, New Jersey. This laboratory is certified to perform project analyses by the New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP).

### **1.1 LABORATORY DATA PACKAGES**

The laboratory data package turnaround time, defined as the time from sample receipt by the laboratory to receipt of the analytical data packages by Parsons, was 14 days for the project samples.

The data packages received from TAL were paginated, complete, and overall were of good quality. Comments on specific quality control (QC) and other requirements are discussed in detail in the attached data validation report which is summarized in Section 2.

### **1.2 SAMPLING AND CHAIN-OF-CUSTODY**

The samples were collected, properly preserved, shipped under a chain-of-custody (COC) record, and received at TAL within one to two days of sampling. All samples were received intact and in good condition at the laboratory.

### **1.3 LABORATORY ANALYTICAL METHODS**

Groundwater samples were collected from the site and analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, and cyanide. Summaries of issues concerning these laboratory analyses are presented in Subsections 1.3.1 through 1.3.3. The data qualifications resulting from the data validation review and statements on the laboratory analytical precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) are discussed for each analytical method in Section 2. The laboratory data were reviewed and may be qualified with the following validation flags:

- "U" - not detected at the value given,
- "UJ" - estimated and not detected at the value given,
- "J" - estimated at the value given,
- "J+" - estimated biased high at the value given,
- "J-" - estimated biased low at the value given,
- "N" - presumptive evidence at the value given, and
- "R" - unusable value.

The validated laboratory data were tabulated and are presented in Attachment A.

### **1.3.1 Volatile Organic Analysis**

Groundwater samples were analyzed for VOCs using the USEPA SW-846 8260C analytical method. Certain reported VOC analytical results were qualified as estimated based upon instrument calibrations. The reported VOC analytical results were 100% complete (i.e., usable) for the analytical data. PARCCS requirements were met.

### **1.3.2 Semivolatile Organic Analysis**

Groundwater samples were analyzed for SVOCs using the USEPA SW-846 8270D analytical method. Certain reported results for the groundwater SVOC samples were qualified as estimated based upon laboratory control sample (LCS) recoveries and instrument calibrations. The reported SVOC analytical results were 100% complete (i.e., usable) for the analytical data. PARCCS requirements were met.

### **1.3.3 Inorganic Analysis**

Groundwater samples were analyzed for metals and cyanide using the USEPA SW-846 6010D/7470A/9012B analytical methods. Certain reported results for the inorganic samples were qualified as estimated based upon matrix spike recoveries and instrument calibrations. The reported inorganic analytical results were 100% complete (i.e., usable) for the analytical data. PARCCS requirements were met.

## **SECTION 2**

### **DATA VALIDATION REPORT**

#### **2.1 GROUNDWATER SAMPLES**

Data review has been completed for data packages generated by TAL containing analytical results from groundwater samples collected from the site. All of these samples were properly preserved, shipped under a COC record, and received intact by the analytical laboratory. Analytical data were submitted in sample delivery groups (SDGs) 460-169523-1 and 460-169869-1.

Data validation was performed for all samples in accordance with the most current editions of the USEPA Region II SOPs for organic and inorganic data review. This data validation and usability report is presented by analysis type. The validated laboratory data are presented in Attachment A.

##### **2.1.1 Volatiles**

The following items were reviewed for compliancy in the volatile analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) precision and accuracy
- Laboratory control sample (LCS) recoveries
- Laboratory method blank and trip/equipment blank contamination
- GC/MS instrument performance
- Initial and continuing calibrations
- Internal standard area counts and retention times
- Field duplicate precision
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of MS/MSD precision and accuracy, LCS recoveries, blank contamination, and continuing calibrations as discussed below.

##### MS/MSD Precision and Accuracy

All MS/MSD precision (relative percent difference; RPD) and accuracy (percent recovery; %R) measurements were considered acceptable and within QC limits for designated spiked project samples with the exception of the many high MS accuracy results and the low MSD accuracy result for vinyl chloride during the spiked analyses of sample MW-CSB-60. Validation qualification of the parent sample was not required.

##### LCS Recoveries

All LCS recoveries were considered acceptable and within QC limits with the exception of the high LCS recoveries for 1,1-dichloroethene (126%R; QC limit 74-123%R), chloroform (123%R; QC limit 80-120%R), and trans-1,2-dichloroethene (128%R; QC limit 79-120%R) associated with sample MW-30. Validation qualification was not required for this sample since these compounds were not detected.

#### Blank Contamination

The field equipment blank FB-11142018 associated with samples collected on 11/14/18 contained methylene chloride at a concentration of 4.1 µg/L; and the trip blank associated with sample MW-38 contained methylene chloride below the reporting limit at a concentration of 0.36 µg/L. Validation qualification of these samples was not required.

#### Continuing Calibrations

All continuing calibration compounds were compliant with a minimum relative response factor (RRF) of 0.05 (0.01 for poor performers) and a percent difference (%D) within  $\pm 20\%$  ( $\pm 40\%$  for poor performers) with the exception of bromomethane (-29.3%D, -35.7%D, -43.9%D) in the continuing calibrations associated with sample MW-30 and samples collected on 11/21/18; bromoform (-31.9) in the continuing calibration associated with samples with lab IDs 460-169523-2, -3, -5, -7, -8, -13, and -14; and 1,1-dichloroethene (21.6%D), trans-1,2-dichloroethene (25.8%D), 1,4-dioxane (63.8%D), and bromoform (-26.1%D) in the continuing calibration associated with samples with lab IDs 460-169523-4, -6, -9, -11, and -12. Therefore, the results for these compounds which were nondetects were considered estimated and qualified "UJ" for the affected samples.

#### Usability

All volatile sample results were considered usable following data validation.

#### Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, comparability, and sensitivity. The volatile groundwater data presented by TAL were 100% complete (i.e., usable). The validated volatile laboratory data are tabulated and presented in Attachment A.

### **2.1.2 Semivolatiles**

The following items were reviewed for compliancy in the semivolatile analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- MS/MSD precision and accuracy
- LCS recoveries
- Laboratory method blank and equipment blank contamination
- GC/MS instrument performance
- Initial and continuing calibrations
- Internal standard area counts and retention times
- Field duplicate precision

- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of the surrogate recoveries, MS/MSD precision and accuracy, LCS recoveries, and continuing calibrations as discussed below.

#### Surrogate Recoveries

All surrogate recoveries were considered acceptable and within QC limits except for the high surrogate recoveries for phenol-d5 (QC limit 14-39%R) and nitrobenzene-d5 (QC limit 51-108%R) in sample MW-27 (42%R and 112%R, respectively). Validation qualification for this sample was not required.

#### MS/MSD Precision and Accuracy

All MS/MSD precision (relative percent difference; RPD) and accuracy (percent accuracy; %R) measurements were considered acceptable and within QC limits for designated spiked project samples with the exception of the high MSD accuracy result for phenol during the spiked analyses of sample MW-CSB-60. Validation qualification of the parent sample was not required.

#### LCS Recoveries

All LCS recoveries were considered acceptable and within QC limits with the exception of the high LCS recoveries for phenol (46%R, 45%R; QC limit 16-43%R) associated with all samples. Therefore, positive results for this compound were considered estimated, possibly biased high, and qualified "J+" for the affected samples.

#### Continuing Calibrations

All continuing calibration compounds were compliant with a minimum relative response factor (RRF) of 0.05 (0.01 for poor performers) and a percent difference (%D) within  $\pm 20\%$  ( $\pm 40\%$  for poor performers) with the exception of 2,4-dinitrophenol (54%D) in the continuing calibration associated with sample MW-19. Therefore, the nondetected result for this compound was considered estimated and qualified "UJ" for the affected sample.

#### Usability

All semivolatile sample results were considered usable following data validation

#### Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, comparability, and sensitivity. The groundwater semivolatile data presented by TAL were 100% complete (i.e., usable). The validated semivolatile laboratory data are tabulated and presented in Attachment A.

### **2.1.3 Inorganics**

The following items were reviewed for compliancy in the inorganics analysis:

- Custody documentation
- Holding times
- Matrix spike/matrix spike duplicate (MS/MSD) precision and accuracy

- Laboratory control sample (LCS) recoveries
- Laboratory preparation blank and equipment blank contamination
- ICP serial dilutions
- Interference check sample (ICS) recoveries
- Initial and continuing calibration verifications
- Laboratory duplicate precision
- Field duplicate precision
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with exception of matrix spike recoveries and calibrations as discussed below.

#### Matrix Spike Recoveries

All matrix spike recoveries were considered acceptable and within the 75-125%R QC limit with the exception of the high matrix spike recoveries for cyanide (115%R, 118%R; QC limit 90-110%R) associated with sample MW-CSB-60. Therefore, the cyanide result was considered estimated and qualified "J" for the affected sample.

#### Calibrations

All initial and continuing calibration verifications were analyzed at the appropriate frequency and within QC limits. All reference standard recoveries were within QC limits with the exception of iron (141%R; QC limit 70-130%R) associated with samples in SDG 460-169523-1. Therefore, positive iron results were considered estimated, possibly biased high, and qualified "J+" for the affected samples.

#### Usability

All inorganic sample results were considered usable following data validation.

#### Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, comparability, and sensitivity. The inorganic groundwater data presented by TAL were 100% complete (i.e., usable). The validated inorganics laboratory data are tabulated and presented in Attachment A.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	RPD of the LCS and LCSD exceeds the control limits
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
X	Surrogate is outside control limits

### GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
X	Surrogate is outside control limits

### Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

### General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

## Glossary

### Abbreviation

**These commonly used abbreviations may or may not be present in this report.**

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)

### Glossary (Continued)

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

**Job ID: 460-169523-1**

**Laboratory: TestAmerica Edison**

Narrative

## CASE NARRATIVE

**Client: Parsons Corporation**

**Project: Farrington St. MGP**

**Report Number: 460-169523-1**

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

### RECEIPT

The samples were received on 11/16/2018 7:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 3.2° C and 3.5° C.

### **Receipt Exceptions**

Limited sample volume was provided for the following sample for the SVOC analysis: MW-21 (460-169523-7). Only 1 container was received.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

### **VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples CMW-40 (460-169523-2), CMW-140 (460-169523-3), MW-20 (460-169523-4), FB-11142018 (460-169523-5), MW-CSB-60 (460-169523-6), MW-21 (460-169523-7), MW-27 (460-169523-8), MW-28 (460-169523-9), MW-30 (460-169523-10), MW-25 (460-169523-11), MW-15 (460-169523-12), MW-19 (460-169523-13) and TB- (460-169523-14) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 11/26/2018, 11/27/2018 and 11/28/2018.

Four surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: MW-CSB-60 (460-169523-6[MS]). These results have been reported and qualified.

The continuing calibration verification (CCV) analyzed in batch 460-571228 was outside the method criteria for the following analyte(s): 1,2,3-Trichlorobenzene (biased high) and Bromoform (biased low). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch analytical batch 460-571228

# Case Narrative

Client: Parsons Corporation  
Project/Site: Farrington St. MGP

TestAmerica Job ID: 460-169523-1

## Job ID: 460-169523-1 (Continued)

### Laboratory: TestAmerica Edison (Continued)

recovered outside control limits for the following analyte: 1,4-Dioxane.

The continuing calibration verification (CCV) analyzed in batch 460-571469 was outside the method criteria for the following analyte: 1,1,2,2-Tetrachloroethane, Methyl acetate and Bromoform. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The laboratory control sample (LCS) for analytical batch 460-571469 recovered outside control limits for the following analytes: 1,1-Dichloroethene, Chloroform and trans-1,2-Dichloroethene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The continuing calibration verification (CCV) analyzed in batch 460-571302 was outside the method criteria for the following analyte(s): 1,4-Dioxane, Chlorobromomethane, 1,2,3-Trichlorobenzene, Chloroform, 1,1-Dichloroethene, 1,1,2-Trichloro-1,2,2-trifluoroethane, Trichlorofluoromethane and trans-1,2-Dichloroethene (biased high) and Bromoform. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Several analytes failed the recovery criteria high for the Matrix Spike (MS) of sample MW-CSB-60MS (460-169523-6) in batch 460-571228.

Vinyl chloride failed the recovery criteria low for the Matrix Spike Duplicate (MSD) of sample MW-CSB-60MSD (460-169523-6) in batch 460-571228. 1,4-Dioxane, Dichlorodifluoromethane and Methyl acetate exceeded the RPD limit.

Refer to the QC report for details.

Samples CMW-40 (460-169523-2)[10X], CMW-140 (460-169523-3)[10X], MW-20 (460-169523-4)[2X] and MW-30 (460-169523-10)[25X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

### SEMOVOLATILE ORGANIC COMPOUNDS (GC/MS)

Samples CMW-40 (460-169523-2), CMW-140 (460-169523-3), MW-20 (460-169523-4), FB-11142018 (460-169523-5), MW-CSB-60 (460-169523-6), MW-21 (460-169523-7), MW-27 (460-169523-8), MW-28 (460-169523-9), MW-30 (460-169523-10), MW-25 (460-169523-11), MW-15 (460-169523-12) and MW-19 (460-169523-13) were analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 11/20/2018 and analyzed on 11/21/2018 and 11/22/2018.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 460-569917 and analytical batch 460-570132 recovered outside control limits for the following analytes: Phenol. These analytes were biased high in the LCS/LCSD; therefore, the data have been reported.

Surrogates recoveries for the following method blank (MB), laboratory control sample (LCS), and laboratory control sample duplicate (LCSD) associated with batch 460-569917 were outside the upper control limits. Samples and MS/MSD surrogates were within limits. Sample has been qualified and reported.

Surrogate recovery for the following sample was outside the upper control limit: MW-27 (460-169523-8). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

The continuing calibration verification (CCV) associated with batch 460-570345 recovered above the upper control limit for 2,4-Dinitrophenol, 2-Nitrophenol, 4,6-Dinitro-2-methylphenol, Butyl benzyl phthalate and Di-n-octyl phthalate. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCVIS 460-570345/2).

Phenol-d5 (Surr) failed the surrogate recovery criteria high for LCS 460-569917/2-A and LCSD 460-569917/3-A.

# Case Narrative

Client: Parsons Corporation  
Project/Site: Farrington St. MGP

TestAmerica Job ID: 460-169523-1

## Job ID: 460-169523-1 (Continued)

### Laboratory: TestAmerica Edison (Continued)

Phenol failed the recovery criteria high for the MSD of sample MW-CSB-60MSD (460-169523-6) in batch 460-570132.

Refer to the QC report for details.

Sample MW-19 (460-169523-13)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

### METALS

Samples CMW-36 (460-169523-1), CMW-40 (460-169523-2), CMW-140 (460-169523-3), MW-20 (460-169523-4), FB-11142018 (460-169523-5), MW-CSB-60 (460-169523-6), MW-21 (460-169523-7), MW-27 (460-169523-8), MW-28 (460-169523-9), MW-30 (460-169523-10), MW-25 (460-169523-11), MW-15 (460-169523-12) and MW-19 (460-169523-13) were analyzed for Metals in accordance with 6010D. The samples were prepared on 11/27/2018 and analyzed on 11/28/2018.

Iron failed the recovery criteria low for the MS of sample MW-CSB-60MS (460-169523-6) in batch 460-571683. Sodium failed the recovery criteria high.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Samples CMW-36 (460-169523-1)[5X], MW-CSB-60 (460-169523-6)[5X], MW-21 (460-169523-7)[5X], MW-30 (460-169523-10)[5X] and MW-15 (460-169523-12)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

### TOTAL MERCURY

Samples CMW-36 (460-169523-1), CMW-40 (460-169523-2), CMW-140 (460-169523-3), MW-20 (460-169523-4), FB-11142018 (460-169523-5), MW-CSB-60 (460-169523-6), MW-21 (460-169523-7), MW-27 (460-169523-8), MW-28 (460-169523-9), MW-30 (460-169523-10), MW-25 (460-169523-11), MW-15 (460-169523-12) and MW-19 (460-169523-13) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 11/29/2018.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

### TOTAL CYANIDE

Samples CMW-36 (460-169523-1), CMW-40 (460-169523-2), CMW-140 (460-169523-3), MW-20 (460-169523-4), FB-11142018 (460-169523-5), MW-CSB-60 (460-169523-6), MW-21 (460-169523-7), MW-27 (460-169523-8), MW-28 (460-169523-9), MW-30 (460-169523-10), MW-25 (460-169523-11), MW-15 (460-169523-12) and MW-19 (460-169523-13) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012B. The samples were prepared and analyzed on 11/28/2018.

Cyanide, Total failed the recovery criteria high for the MS of sample MW-CSB-60MS (460-169523-6) in batch 460-571712.

Cyanide, Total failed the recovery criteria high for the MSD of sample MW-CSB-60MSD (460-169523-6) in batch 460-571712.

Refer to the QC report for details.

No other difficulties were encountered during the cyanide analysis.

All other quality control parameters were within the acceptance limits.

If pH adjustments are required record the information below:

Sample No(s). adjusted: \_\_\_\_\_

Preservative Name/Conc.: \_\_\_\_\_

Lot # of Preservative(s): \_\_\_\_\_

The appropriate Project Manager and Department Manager should be notified about the samples which were pH adjusted.  
\* Samples for Metal analysis which are out of compliance must be acidified at least 24 hours prior to analysis.

Initials: \_\_\_\_\_

Expiration Date: \_\_\_\_\_

Volume of Preservative used (ml): \_\_\_\_\_

## Login Sample Receipt Checklist

Client: Parsons Corporation

Job Number: 460-169523-1

**Login Number:** 169523

**List Source:** TestAmerica Edison

**List Number:** 1

**Creator:** Rivera, Kenneth

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	False	Refer to Job Narrative for details.
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.

## Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

## General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.

## Glossary

### Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

## CASE NARRATIVE

**Client: Parsons Corporation**

**Project: Farrington St. MGP**

**Report Number: 460-169869-1**

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

### **RECEIPT**

The samples were received on 11/21/2018 4:07 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.5° C.

### **Receipt Exceptions**

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. No turnaround time indicated in COC.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

### **VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples MW-38 (460-169869-1) and TB-11212018 (460-169869-2) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 11/30/2018 and 12/01/2018.

The continuing calibration verification (CCV) analyzed in batch 460-572143 was outside the method criteria for the following analytes: Bromomethane and Dichlorodifluoromethane. The minimum response factor (RF) for Bromomethane was outside required limits. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analytes is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 460-572342 was outside the method criteria for the following analyte(s): Dichlorodifluoromethane, Chloromethane and Bromomethane. The response factor for Bromomethane was below the minimum required. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

# Case Narrative

Client: Parsons Corporation  
Project/Site: Farrington St. MGP

TestAmerica Job ID: 460-169869-1

## Job ID: 460-169869-1 (Continued)

### Laboratory: TestAmerica Edison (Continued)

All other quality control parameters were within the acceptance limits.

#### **SEMIVOLATILE ORGANIC COMPOUNDS (GC/MS)**

Sample MW-38 (460-169869-1) was analyzed for semivolatile organic compounds (GC/MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 11/25/2018 and analyzed on 11/26/2018.

The laboratory control sample (LCS) for preparation batch 460-570966 and analytical batch 460-570911 recovered outside control limits for the following analytes: Phenol. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

#### **METALS**

Sample MW-38 (460-169869-1) was analyzed for Metals in accordance with 6010D. The samples were prepared on 11/29/2018 and analyzed on 12/02/2018.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the Metals analysis.

All other quality control parameters were within the acceptance limits.

#### **TOTAL MERCURY**

Sample MW-38 (460-169869-1) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 12/04/2018.

No difficulties were encountered during the Hg analysis.

All quality control parameters were within the acceptance limits.

#### **TOTAL CYANIDE**

Sample MW-38 (460-169869-1) was analyzed for total cyanide in accordance with EPA SW-846 Method 9012B. The samples were prepared and analyzed on 11/29/2018.

Cyanide, Total failed the recovery criteria low for the Matrix Spike (MS) of sample 460-169542-5 in batch 460-571958.

Cyanide, Total failed the recovery criteria high for the Matrix Spike Duplicate (MSD) of sample 460-169872-3 in batch 460-571958.

Refer to the QC report for details.

No other difficulties were encountered during the cyanide analysis.

All other quality control parameters were within the acceptance limits.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Subject: **Fluid Properties Package – (Density; Specific Gravity; Viscosity & Interfacial Tension (IFT))**

Dear Dan Martoccia,

Please find enclosed report for Physical Properties analyses conducted upon samples received from your **Cow Edison Farrington, MGP** project. All analyses were performed by applicable ASTM, EPA, or API methodologies. The samples are currently in storage and will be retained for thirty days past the completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact myself or Emeka Anazodo at (713) 316-1800.

Sincerely,  
PTS Laboratories, Inc.

### Laboratory Test Program Notes

Standard TAT for basic analysis is 10-15 business days. completion of analyses.

**Fluid Properties Package - LNAPL & Water:** Includes dynamic viscosity and fluid density at three temperatures (70, 100 and 130°F),

surface tension for each fluid, and interfacial tensions (three phase pairs; oil/water, oil/air, and water/air (at ambient laboratory temperature)).

If no groundwater received, use filtered SFS tap water for interfacial tension testing.

The figure is a semi-logarithmic plot showing the relationship between normalized head ( $h/h_0$ ) and time (s) for a slug test. The y-axis,  $h/h_0$ , is on a logarithmic scale with major ticks at  $1E-2$ ,  $1E-1$ , and  $1EO$ . The x-axis, Time [s], is also on a logarithmic scale with major ticks at  $0E0$ ,  $5.2E0$ ,  $1E1$ ,  $1.6E1$ ,  $2.1E1$ ,  $2.6E1$ ,  $3.1E1$ ,  $3.6E1$ ,  $4.2E1$ ,  $4.7E1$ , and  $5.2E1$ . The data points, represented by purple downward-pointing triangles and labeled "MW27", show a rapid initial decline in head ratio followed by a more gradual decay. A solid black line represents a theoretical exponential decay curve.

## 1.0 INTRODUCTION

### 1.1 Purpose

This report summarizes the groundwater modeling that was conducted as part of the Supplemental Remedial Investigation (SRI) activities outlined in the *Former Farrington Street Manufactured Gas Plant Site (Site No. V00560) Supplemental Remedial Investigation Work Plan* (SRIWP) (Parsons, 2018) approved by the New York State Department of Environmental Conservation (NYSDEC) on September 12, 2018. The purpose of the model was to qualitatively and quantitatively evaluate groundwater flow at the former Farrington Street Gas Works Site (the “Site”) located in Queens, New York with specific relevance to the remedial scenarios of *In-Situ* Stabilization (ISS) and barrier wall containment. This document describes groundwater flow modeling to provide hydrogeologic support for remedial improvement scenarios for the Consolidated Edison Company of New York, Inc. (Con Edison) for the former Farrington Street Gas Works Site (the “Site”) located in Queens, New York

Utilizing data collected during the SRI activities, a numerical finite difference groundwater model was developed, constructed, and calibrated (with sensitivity testing) to simulate groundwater flow conditions, and identify groundwater particle paths and associated velocities for the Site. The steady state model was calibrated to one set of synoptic water levels using existing and new groundwater hydraulic information (transmissivity, regional gradients, aquifer architecture, potential for tidal influences, etc. collected during SRI field activities).

The preliminary groundwater modeling addressed three scenarios for the Site:

- Scenario 1 – simulate existing subsurface conditions at the Site;
- Scenario 2 – simulate subsurface conditions at the Site should the remedy include perimeter containment barriers at Parcels 1 and 2 and in vicinity of the Market Area of Parcel 1 (“Market Area”); and
- Scenario 3 – simulate subsurface conditions at the Site should the remedy include in-situ soil stabilization/solidification (ISS) at Parcels 1 and 2 and a perimeter containment barrier in vicinity of the Market Area.

### 1.2 Approach

This report provides the documentation for the groundwater modeling so that the team can review the model with stakeholders and revise as necessary. **Figure 1** provides a process diagram of model construction, calibration, and predictive scenarios.

## 2.0 MODEL DESIGN

### 2.1 Model Code

MODFLOW-2005 (Harbaugh 2005) and MODPATH Version 5 (Pollock 1994) were used for this groundwater modeling effort. MODFLOW-2005 is being used for flow only

simulations and groundwater flow paths are delineated using MODPATH Version 5. Both models are well-known, well-documented, and in the public domain. Environmental Simulations Incorporated (ESI) Ground Water Vistas (Version 2) was used as the graphic user interface (GUI) to manage pre- and post-process data. For flow-only testing, the MODFLOW-2005 model used the Layer Property Flow package solved by the Preconditioned Conjugate-Gradient Package (PCG2). The model was steady state and since the model was built to simulate flow only there are no solvers included for advection, dispersion, retardation, or degradation. To improve the calibration process and complete sensitivity testing the well-known and documented Parameter ESTimation tool (PEST) was used (Doherty, 2010).

All final MODFLOW model runs exhibited 0.0 percent (%) water balance error, indicating that a sufficiently accurate solution of the flow problem was achieved. This is a check on the internal numerical solution and differs from model calibration processes and accuracy of the model relative to real world conditions; see calibration section of detail on model comparison to measured values. Water balance error less than 1% is considered acceptable for this type model (Anderson and Woessner, 1992).

## **2.2 Model Domain, Grid and Boundary Conditions**

A finite difference grid telescoped from 10-foot x 10-foot cells in the area of interest to a maximum size of 100 feet x 100 feet. The area covered 116,000,000 square feet ( $\text{ft}^2$ ) of active area with 188,566 active cells. The vertical domain was discretized in seven layers to a depth of -40 ft AMSL. [Figure 3](#) provides a map of the cell grid, and [Figure 4](#) provides the vertical grid in the area of interest. The layer elevations were determined from boring logs. Using spatial interpolative techniques (kriging) all available data were integrated to create the model structure.

## **2.3 Boundary Conditions**

Multiple MODFLOW packages were included in the model to create boundary conditions and simulate groundwater flow. These include: Recharge Package, Drain Package, River Package, and General Head Package. The River Package was used to simulate Flushing Bay. The General Head Package simulated recharge areas northwest of the Site and also identified on aerial photography. The Drain Package simulated surface water features identified on aerial photography as well as groundwater sink southeast of the Site. Pre- and post-calibration parameters are provided in [Table 2](#).

The Recharge Package simulated vertical recharge to the water table as a means of precipitation as well as evapotranspiration in regions of shallow water table conditions and heavy vegetation. [Table 2](#) provides the pre- and post-calibration values for recharge.

## **2.4 Initial Hydraulic Parameters**

Initial hydraulic parameters such as hydraulic conductivity ( $K_h$  and  $K_v$ ), porosity, dispersivity are provided in [Table 1](#) while [Table 2](#) provides the pre- and post-calibration values. The initial hydraulic conductivity values are based on slug tests, during initial calibration, these values are adjusted within the observed/literature range as part of the

inversion process (incrementally adjusting the values to reduce residuals), see below (section 2.6.1) for more details.

## 2.5 Model Calibration Procedure and Objectives

Water level calibration targets and associated groundwater contour maps are provided in [Figure 2](#). A total of 19 monitoring well measurements were used as targets in the static condition calibration. No weighting of calibration targets was used in the calibration. The initial model was calibrated through trial and error techniques to lower the residual error (target water level elevation minus that simulated) both statistically and qualitatively in the areas of interest. The calibration goals for the groundwater model are scaled root mean squared error of hydraulic head less than 0.1 (dimensionless) and reduced sum of squared residuals (head) to the extent practical.

Initially manual calibration techniques were used along with Site specific observations regarding hydraulic conductivity zones based on drilling observations and aquifer pumping tests. After the initial manual calibration, the well-known and documented Parameter Estimation Tool (PEST) was used to further refine the calculated parameters and test sensitivities for hydraulic conductivity, recharge, and evapotranspiration. [Figure 10](#) demonstrates the overall model progression and the change from manual calibration to PEST. [Figure 11](#) provides a plot of simulated versus observed for each model layer (with calibration targets). [Figure 12](#) provides the relative sensitivities.

### 2.5.1 Calibrated Parameters

After the initial calibration, PEST was run in parameter estimation mode, and provided a revised set of hydraulic conductivities, recharge, and evapotranspiration. Subsequently, these values were slightly altered from the PEST runs to remove non-sensitive discrepancies and remove exaggerated values created by the PEST auto-calibration.

[Table 2](#) provides the PEST calibrated parameter values as well as the initial manual calibration parameters, for comparison. [Figures 5](#) through [8](#) provide the hydraulic conductivity zones in each layer.

The model was calibrated using regional information (surface water bodies), field data (hydraulic head measurements), and inverse modeling processes (software algorithms). Once calibrated objectives were met and the model produced agreeable results, predictive scenarios were developed. Regional recharge to the aquifer was estimated at a low value of 1.16 inches per year, but slightly above published value of 0.89 inches per year. Due to the localized Market Area retail building the recharge under this building was reduced to 0.22 inches per year to support calibration. It was observed that because of the steady state simulation, and the idealized nature of the model, elevated water mounding occurred in the Parcel 1. Therefore, predictive model runs were established with calibrated recharge and zero recharge for the three parcels. While surface improvements and engineering design can further reduce recharge in parcels, it remains unknown if recharge could be reduced to zero. As such, for the varying recharge predictive scenarios, the calibrated recharge and zero recharge simulations provide a range of groundwater velocities and it is likely the actual velocity would be near the mean.

### 3.0 RESULTS

**Figures 13** through **15** demonstrate the results from each scenario and are summarized here. **Figure 16** provides a comparison of groundwater velocities.

Existing Conditions:

- The groundwater flow under existing conditions travels to the southeast off of a slightly elevated groundwater mound, on top of the clay observed under the parking lot area and northwest of the Site; and
- Based on the calibrated model, the existing groundwater velocity through the Site is low to moderate varying from approximately 10 to 54 feet per year.

Subsurface Barrier Wall:

- In the parking lot area of Parcel 1, the simulated particle velocities decreased to negligible rates of approximately 3 feet per year using calibrated recharge, and 0.06 feet per year assuming no recharge to the water table. This is due to the result of the low permeability underlying clay and the typical conductivity of subsurface barrier walls (e.g.,  $10^{-7}$  centimeters per second);
- In the Market Area, the simulated particle velocities decreased due to groundwater being diverted around this area. On the western side of the Market Area, the simulated average particle velocity is reduced to 6 feet per year due to the decrease in head that would be caused by the subsurface barrier walls nearly surrounding the parcel. Near the east side of the Site, the average linear velocity would be approximately 28 feet per year; and
- In the southern area (Parcel 2) of the Site, simulated particle velocities decreased to approximately 3 feet per year due to the lower recharge and low vertical hydraulic conductivity of the sand in this unit (0.32 feet per day to 2 feet per day).

ISS:

- Under this remedial scenario, ISS would be performed in the parking lot area of Parcel 1, and within Parcel 2, as noted on **Figure 15**. No particles were tracked from within the ISS areas, as it was assumed the ISS would eliminate flux; and
- In the Market Area, the groundwater flow was reduced to similar rates as the subsurface barrier wall alternative. On the western side of the Market Area, the average linear velocity was reduced to 7 feet per year. Closer to the east side of the Site the average linear velocity was approximately 28 feet per year.

Overall, the results of the groundwater modeling indicate that there is minimal difference between a subsurface barrier wall remedy compared to an ISS remedy for the Site in terms of overall effectiveness in reducing the potential for contaminant migration off-site. In both scenarios, groundwater flow in the parking lot area of Parcel 1 is fully contained, and groundwater flow in the majority of the Market Area and Parcel 2 is reduced to less than 10 feet per year. Furthermore, groundwater flowing from each parcel follows a path onto the adjacent Holder site which is currently under natural attenuation monitoring and will continue to be monitored for impacts from the Site. Lastly, groundwater flow in the

eastern portion of the Market Area can be further reduced should a subsurface barrier wall be extended or added in this area of the Site.

## 4.0 ASSUMPTIONS

The following assumptions were made for the model:

- It was assumed that the barrier walls can be installed as established in the groundwater model and there is no leakage through weaknesses or imperfections in the design or construction.
- Recharge can be further reduced to eliminate any mounding and ponding of water within the parking lot barrier walls.
- There is no anthropogenic input of water such as leaking piping or sewers.
- Recharge in the region is low at approximately 1-2 inches per year.

- GROUNDWATER MONITORING WELL
- INFERRRED GROUNDWATER
- (1.1') NOVEMBER 2018 GROUNDWATER ELEVATIONS (FT AMSL)
- NOTES:
1. GROUNDWATER ELEVATIONS IN FEET AMSL
  2. GROUNDWATER ELEVATION DATA COLLECTED 11/13/2018
  3. LNAPL WAS MEASURED IN MONITORING WELLS MW-15 AND MW-19 DURING THE NOVEMBER 2018 GAUGING EVENT. A SPECIFIC GRAVITY OF 0.93 WAS USED TO CALCULATE A CORRECTION FACTOR THAT WAS USED TO ADJUST GROUNDWATER ELEVATIONS IN THESE WELLS.
  4. THE FOLLOWING MONITORING WELLS COULD NOT BE LOCATED OR WERE DAMAGED AT THE TIME OF GAUGING: MW-13, MW-14, MW-16, MW-17, MW-18, MW-22, CMW-37, AND CMW-39.
